From a Highway Structures perspective I would wholly support any application to infill this redundant bridge. The bridge has been assessed as being substandard. Wiltshire Council did look at infilling the bridge when it undertook similar works to the redundant rail bridge in Potterne Rd Devizes but at the time didn't pursue the scheme due to difficulties over access. Wiltshire Council undertook identical works on the adjacent Potterne Rd Bridge under permitted development rights as Highway Authority, Heritage Railway Estate are a wholly managed subsidiary of the Department for Transport, also a Highway Authority so it may be permitted development rights already exist.

Subject: Disused Railway Bridge BHL 85m 38ch "Hillworth Road Bridge" – Infilling works

Dear Sir/Madam

I am writing to you on behalf of our Client, Highways England, Historical Railways Estate (HRE), formerly BRB (Residuary) Ltd to inform you of planned support works to the structure BHL 85m 38ch via structural infill. HRE is responsible for the Historical Railways Estate following the abolishment of BRB (Residuary) Ltd. This responsibility is undertaken on behalf of the Department for Transport, who own the structure. Therefore, the structure is crown property.

BHL 85m 38ch, Hillworth Road Bridge, a single span brick arch bridge constructed circa 1857. The structure is in a deteriorating condition with a number of fractures through the arch barrel. It carries an unclassified road over the trackbed of the former Devizes Branch (Patney to Holt) railway line. The nearest postcode is SN10 5EU. It is located at approximate OS grid reference SU 005 610. A location plan is enclosed for your information.

As the structure represents an ongoing and increasing risk to public safety and is owned by the Secretary of State for Transport, so is deemed 'Crown Property', Highways England HRE propose to undertake the support works as permitted development in line with the 'Town & Country Planning (General Permitted Development) (England) Order 2015, Schedule 2, Part 19 Class Q'. Specifically, and for the avoidance of any ambiguity, the works are being undertaken in order to prevent an emergency arising.

Can you please confirm receipt of this letter by return email: hreprioritystructu@jacobs.com. Please do not hesitate to contact me should you require any further information.

Yours faithfully

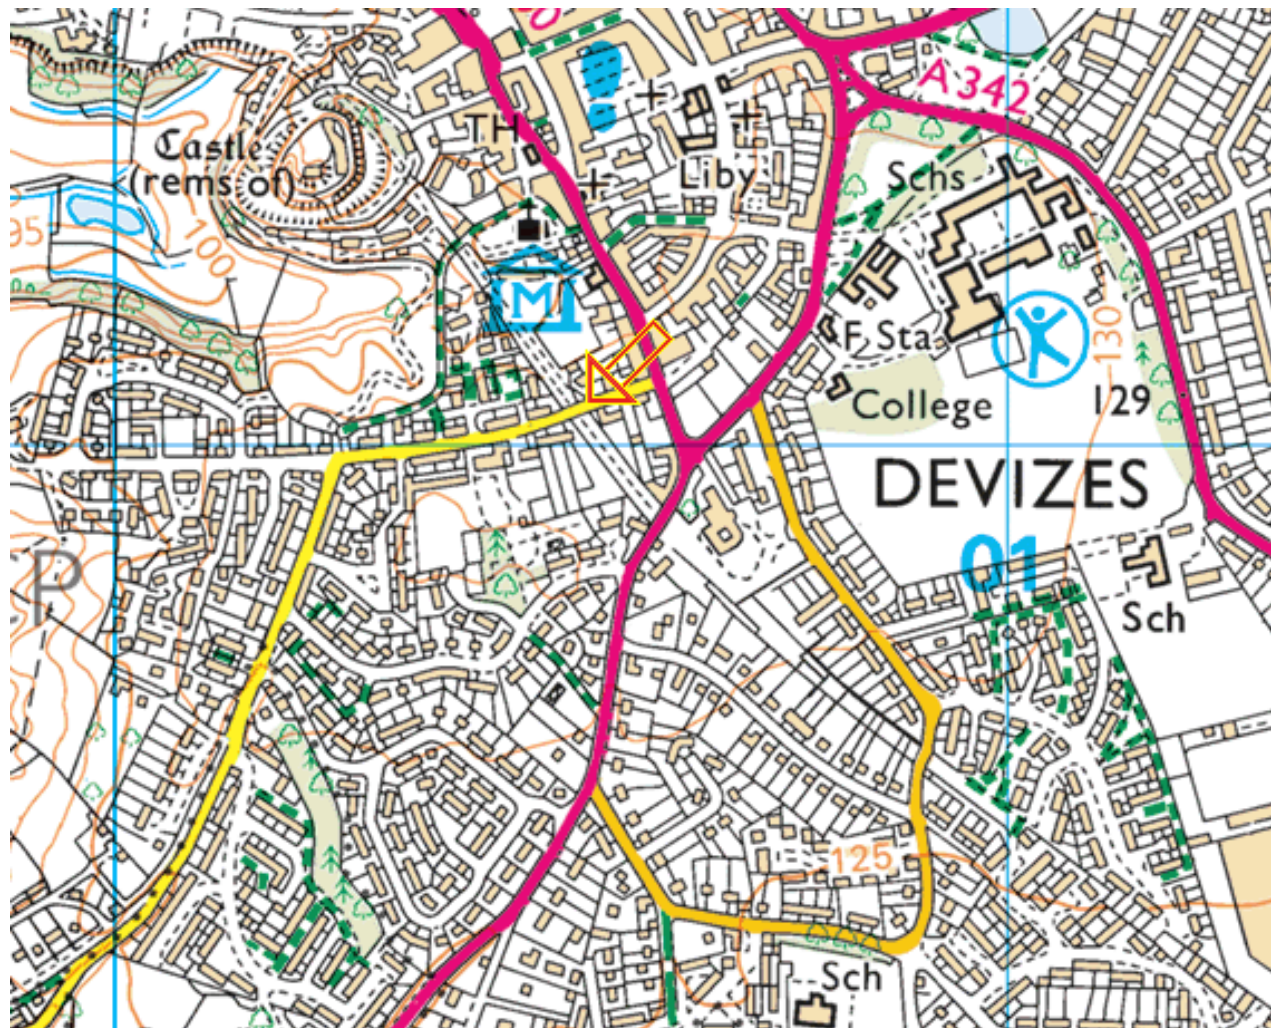

Civil Engineer

| Nearest Post Code | SN10 5EU |

I write further to my email below on the 20th May 2020 in relation to the above pre-application enquiry.

I have received feedback from various internal consultees which is as follows:

- **Council Conservation Officer** – “I am of the view that the railway and railway bridges are considered to be heritage assets. As the Conservation Area Statement for Devizes (*copy attached*) states one of the key features of the Castle area is the line of the former railway that ran under the castle and now forms the western boundary to the Conservation Area. Wayside Cottage the former stables and coach house to Hillworth House is the closest listed building.

I am unsure how the site will be accessed but if it is near Wayside cottage there needs to be adequate protection of the cottage from accidental damage. In terms of the infilling of the bridge this is an irreversible process, but it will secure the road bridge element and it appears that there is no public access to the railway side. The work is undesirable in terms of the railway element but may be necessary to ensure the structural integrity of the bridge.”

- **Council Arboricultural Officer** – “I have no objections to the proposed works in principle and would be lead by the ecological appraisal as this area is a rich source of wildlife.

There are many trees situated along both embankments which regularly collapse over the previous trackway. As this area is protected by virtue of a TPO, it would be necessary for the applicant to submit details of any tree removals in relation to the planned restructuring and how it may affect the overall cohesive nature of the land in conjunction with the ecological findings.

I’m not sure whether the owners/applicants are considered ‘Statutory Undertakers’ in respect of the Town and Country Planning Act 1990 or Town and Country Planning (Tree Preservation) (England) Regulations 2012, so I think a formal TPO application and tree assessment would be needed in this instance unless it can be demonstrated that they are exempt”.

- **Council Public Protection Officer** – I’ve attached the standard guidance booklet from the Environmental Health department for your information.
- **Council Drainage Engineer** – “There isn’t really much to add from a drainage perspective, no flood risk in the area. The drainage is assumed to run onto the disused railway as the low point which is not going to cause a flood risk to anyone.

At further application stage we will want a bit more detail about the surface water drainage strategy, this however sounds like it has already been considered in the attached doc (*covering letter dated 23rd April 2020 by Jacobs*).

The surface water flood risk maps also appear to show the flow of storm water along the disused railway, we will want to see evidence that the infill will not create a blockage of such flows and potential increase to flood risk behind the structure.”

- **Council Ecologist** – “Some years ago, the ecology team were engaged by the Bridges and Structures team of Wiltshire Council to look into the need to infill an adjacent bridge to Hillworth Road Bridge. That bridge was to the south, next to SouthBridge/Southgate House. The disused railway line was shown to be a key piece of wildlife corridor network, supporting badger setts and bat roosts. I understand that this previous bridge has since been filled in by the council, and various badger and bat mitigation was included; this incorporated badger tunnels running through the infilling.

The previous ecological survey work found that bat/s were already roosting in Hillworth Road bridge and that bat boxes were erected on the bridge too. The old railway forms a significant link that various bat species found in Devizes likely commute across town between habitat features outside the urban settlement, and they will use the dark space underneath the bridge to move. Likewise badgers currently have free movement along the railway. By filling in Hillworth Road bridge it completely severs the connection it currently provides for wildlife.

I suggest that you liaise with the Bridges and Structures team (Julian Haines) at the council, and Fiona Elphick who worked with the team on the previous bridge project, to establish what current and historical knowledge there is of the disused railway. Further any future application will need to be supported by, as a minimum:

- Badger and bat surveys of the bridge
- Records of any use of previous bat boxes on the bridge by bats
- Evidence showing the functionality of the old railway line for movement of wildlife
- Evidence showing that the development results in Biodiversity Net Gain; compensatory measures off site may be required to achieve this.”

The **Highway Authority** (comments provided by Julian Haines) has previously expressed support for the proposal as outlined within my email below. However, in light of the comments outlined above, the proposed development has the potential to have a significant ecological impact and affect trees protected by a Tree Preservation Order.

I trust these observations will be of assistance but I would be grateful if you could clarify whether you consider the works can be undertaken under permitted development rights. Furthermore, if you would like to discuss the proposal in further detail or contact relevant departments (Highway Authority – Julian Haines | Ecology – Fiona Elphick | Trees – David Wyatt) please let me know.

Project Name: HRE Works Framework

Project Number: B28280JA

FAO: [REDACTED]

Dear [REDACTED]

Re: Disused Railway Bridge BHL 85m 38ch "Hillworth Road Bridge" – Infilling Works

I write in relation to your letter dated 21st April 2020 in regarding the above.

I note you your enquiry seeks general comments from the Local Planning Authority on the proposal and detail of any constraints that may be imposed on the works. It is therefore understood that it is your intention to apply for full planning permission in due course for the engineering operation. An ecological assessment and an assessment of any impacts on designated sites will also be carried out to inform the works. I note the artistic impression submitted with your letter. Do you have any scaled plans or more precise details of the condition of the bridge or the extent of works to help inform our assessment?

The Local Planning Authority has sought comments from the Council's Public Protection Officer, Highways Officer, Drainage Engineer, Ecologist and Conservation Officer and I'll provide a full response once I have all their observations. I have however carried out an initial desk based assessment to establish the site constraints as see that the trees directly to the south of the bridge are protected by a Tree Preservation Order (ref E/481/W1 – 'trees between Hillworth Road and Potterne Road along the old railway line').

In terms of the planning history of the site, I've identified two applications which relate to the land immediately to the south of the bridge:-

1. Application ref 18/10881/TPO: Tree works within the Old Railway Cutting – Approved 02.01.19;
2. Application K/80/0368: Fill disused railway cutting with waste material and on completion to form part of the adjoining site owned by Watney Mann (West) Limited – Refused 09.10.80.

I have received comments from the Highway Authority who advised me of the following:-

"From a Highway Structures perspective I would wholly support any application to infill this redundant bridge. The bridge has been assessed as being substandard. Wiltshire Council did look at infilling the bridge when it undertook similar works to the redundant rail bridge in Potterne Rd Devizes but at the time didn't pursue the scheme due to difficulties over access. Wiltshire Council

undertook identical works on the adjacent Potterne Rd Bridge under permitted development rights as Highway Authority, Heritage Railway Estate are a wholly managed subsidiary of the Department for Transport, also a Highway Authority so it may be permitted development rights already exist."

In light of the above observations I would be grateful if you could clarify whether you feel the works could benefit from permitted development rights or require full planning permission. If you could also advise of the extent of tree removal required I can obtain the view of the department's Arboricultural Officer who can advise on the need for permission to carry out TPO tree work.

If you would like to discuss the proposal at any stage please let me know and we can schedule a suitable time to discuss.

For the attention of Director of Planning

developmentmanagement@wiltshire.gov.uk

15th February 2021

Dear Sir or Madam

Hillworth Road / Devizes Castle bridge, Devizes

I understand that Highways England is proposing to infill the above bridge, which was part of the former Devizes branch railway. Whilst there may not be any plans to reopen the line, Railfuture believes a case could be made for it in the longer term, partly because the Bowerhill development extends right up to the course of the former railway.

Railfuture strongly supports the proposed Devizes Parkway station as the best way to reconnect Devizes to the rail network in the near future. However, we would also ask your Council to consider safeguarding the formation of the original line with a view to its possible future use.

Yours sincerely

Railfuture

At further application stage we will want a bit more detail about the surface water drainage strategy, this however sounds like it has already been considered in the attached doc (*covering letter dated 23rd April 2020 by Jacobs*).

The surface water flood risk maps also appear to show the flow of storm water along the disused railway, we will want to see evidence that the infill will not create a blockage of such flows and potential increase to flood risk behind the structure."

- **Council Ecologist** – "Some years ago, the ecology team were engaged by the Bridges and Structures team of Wiltshire Council to look into the need to infill an adjacent bridge to Hillworth Road Bridge. That bridge was to the south, next to SouthBridge/Southgate House. The disused railway line was shown to be a key piece of wildlife corridor network, supporting badger setts and bat roosts. I understand that this previous bridge has since been filled in by the council, and various badger and bat mitigation was included; this incorporated badger tunnels running through the infilling."

The previous ecological survey work found that bat/s were already roosting in Hillworth Road bridge and that bat boxes were erected on the bridge too. The old railway forms a significant link that various bat species found in Devizes likely commute across town between habitat features outside the urban settlement, and they will use the dark space underneath the bridge to move. Likewise badgers currently have free movement along the railway. By filling in Hillworth Road bridge it completely severs the connection it currently provides for wildlife.

I suggest that you liaise with the Bridges and Structures team (Julian Haines) at the council, and Fiona Elphick who worked with the team on the previous bridge project, to establish what current and historical knowledge there is of the disused railway. Further any future application will need to be supported by, as a minimum:

- Badger and bat surveys of the bridge
- Records of any use of previous bat boxes on the bridge by bats
- Evidence showing the functionality of the old railway line for movement of wildlife
- Evidence showing that the development results in Biodiversity Net Gain; compensatory measures off site may be required to achieve this."

The **Highway Authority** (comments provided by Julian Haines) has previously expressed support for the proposal as outlined within my email below. However, in light of the comments outlined above, the proposed development has the potential to have a significant ecological impact and affect trees protected by a Tree Preservation Order.

I trust these observations will be of assistance but I would be grateful if you could clarify whether

you consider the works can be undertaken under permitted development rights. Furthermore, if you would like to discuss the proposal in further detail or contact relevant departments (Highway Authority – Julian Haines | Ecology – Fiona Elphick | Trees – David Wyatt) please let me know.

Regards,

Morgan

Subject: Pre-application enquiry ref 20/04024/PREAPP: Disused Railway Bridge at Devizes

Project Name: HRE Works Framework

Project Number: B28280JA

FAO: [REDACTED]

Dear [REDACTED]

Re: Disused Railway Bridge BHL 85m 38ch "Hillworth Road Bridge" – Infilling Works

I write in relation to your letter dated 21st April 2020 in regarding the above.

I note you your enquiry seeks general comments from the Local Planning Authority on the proposal and detail of any constraints that may be imposed on the works. It is therefore understood that it is your intention to apply for full planning permission in due course for the engineering operation. An ecological assessment and an assessment of any impacts on designated sites will also be carried out to inform the works. I note the artistic impression submitted with your letter. Do you have any scaled plans or more precise details of the condition of the bridge or the extent of works to help inform our assessment?

The Local Planning Authority has sought comments from the Council's Public Protection Officer, Highways Officer, Drainage Engineer, Ecologist and Conservation Officer and I'll provide a full response once I have all their observations. I have however carried out an initial desk based assessment to establish the site constraints as see that the trees directly to the south of the bridge are protected by a Tree Preservation Order (ref E/481/W1 – 'trees between Hillworth

Road and Potterne Road along the old railway line’).

In terms of the planning history of the site, I’ve identified two applications which relate to the land immediately to the south of the bridge:-

1. Application ref 18/10881/TPO: Tree works within the Old Railway Cutting – Approved 02.01.19;
2. Application K/80/0368: Fill disused railway cutting with waste material and on completion to form part of the adjoining site owned by Watney Mann (West) Limited – Refused 09.10.80.

I have received comments from the Highway Authority who advised me of the following:-

“From a Highway Structures perspective I would wholly support any application to infill this redundant bridge. The bridge has been assessed as being substandard. Wiltshire Council did look at infilling the bridge when it undertook similar works to the redundant rail bridge in Potterne Rd Devizes but at the time didn’t pursue the scheme due to difficulties over access. Wiltshire Council undertook identical works on the adjacent Potterne Rd Bridge under permitted development rights as Highway Authority, Heritage Railway Estate are a wholly managed subsidiary of the Department for Transport, also a Highway Authority so it may be permitted development rights already exist.”

In light of the above observations I would be grateful if you could clarify whether you feel the works could benefit from permitted development rights or require full planning permission. If you could also advise of the extent of tree removal required I can obtain the view of the department’s Arboricultural Officer who can advise on the need for permission to carry out TPO tree work.

If you would like to discuss the proposal at any stage please let me know and we can schedule a suitable time to discuss.

Regards,

Morgan

- [ProPG: Planning and Noise – Professional Practice Guidance on Planning and Noise](#)

Provides guidance on a recommended approach to the management of noise within the Planning system and encourages the process of good acoustic design for new residential development aiming to protect people from the harmful effects of noise.

Smaller scale projects e.g. a corner shop installing an air conditioning unit, refrigeration plant or other small scale plant/ equipment, will need to assess as far as possible any likely impact from noise on the surrounding community for example; hours of operation of the plant, location of the nearest noise sensitive receptor, noise output of the plant/equipment, acoustic treatments to be installed.

Noise & Dust during the construction phase

If there are residential properties close to your development, you will need to consider how noise & dust will be controlled during the construction phase. The Council recommends that noisy activities should not be carried out on site, outside the following hours:

Monday to Friday 08.00 - 18:00

Saturday 08:00 - 13:00

Not at all on Sundays or Bank Holidays

Where complaints are received from members of the public about noise from the site, a legal notice may be served under the Control of Pollution Act 1974 to formally restrict the time for noisy works.

We would expect a Construction Management Plan to be submitted with any major development whose construction/demolition phase is likely to be ongoing for a long period of time.

Odour impacts

In some instances an odour impact assessment may be required to ensure odour from certain sources (slurry lagoons, sewage works, poultry houses etc.) will not adversely impact upon new or existing residents, which should include appropriate mitigation measures.

Odour from takeaways and restaurants can also be highly intrusive. Appropriate methods of odour dispersal and abatement should be considered by your ventilation engineer. Further guidance can be found at;

- [DEFRA](#); **Guidance on the Control of Odour and Noise from Commercial Kitchen Exhaust Systems 2005**– This has been withdrawn but provides guidance for estimating the odour risk taking into account the stack/exhaust height, size and type of the kitchen and proximity to sensitive receptors

- [IAQM](#); Guidance on the assessment of odour for planning 2018
- [Environmental Health Licences and Permits](#) – Larger industrial plant such as coating & spraying will need to approach their suppliers for specialist advice. You may also require a permit under the Environmental Permitting regulations and you are therefore advised to contract Environmental protection direct

Smoke

Chimneys and flues must be located away from neighbouring windows. Chimneys must be sufficiently high to allow free dispersal; e.g. if you are on a hillside for example you might need a higher chimney than normal to take the smoke away from an adjoining neighbour higher up the hill.

Large scale boiler operators will need to provide a chimney height calculation in accordance with the appropriate relevant guidance such as D1 or the chimney height memorandum.

Light

For developments with proposed significant external light which will have line of sight to residential properties or other sensitive receptors we will require the submission of a lighting impact assessment and proposed mitigation measures in accordance with guidance set out in The Institute of Lighting Professionals [“Guidance Notes for the Reduction of Obtrusive Light”](#).

Further information can be found on the [GOV.UK](#) website under Light Pollution which provides advice on how to consider light within the planning system. Including, the [Guidance on sections 101 to 103 of the Clean Neighbourhoods and Environment Act 2005 – Statutory Nuisance from Insects and Artificial Light](#).

Pests

If it is likely that pests (including flies) may arise from the proposals we would expect the submission of a management plan to detail how pests will be effectively managed and mitigated against to prevent having an adverse impact on local sensitive receptors.

This includes

- [Fly Management Guidance](#)

Informative

This advice is provided without prejudice and all applications will be determined on their individual merits.

Other planning applications

Environmental Impact Assessments

Some complex or large scale developments may require a full Environmental Impact Assessment (EIA) and such developments are defined in the Town and Country Planning (Assessment of Environmental Effects) Regulations 1988 and the Town and Country Planning (Environmental Impact Assessment) Regulations 1999. Any EIA must include references to the impact of noise and other environmental related amenity issues associated with the proposal.

Change of use

If your application involves a change of use for a commercial premises or a change in the hours of operation for a business, you will need to consider the following as part of your application:

- **Change of use** - If in changing the use of the business there is likely to be a change in the noise arising from the business, e.g. a retail unit turning into a bar, you will need to consider this in your application and include details of any potential noise control measures, e.g. improvements to sound insulation, noise limiters, lobby doors, double glazing, noise management plan
- **Change in the hours of operation** - you will need to check with Planning Services whether there are any conditions relating to the hours of operation on the current planning permission. They can be contacted by telephone; 0300 456 0114 or by email Developmentmanagement@wiltshire.gov.uk and further advice can be accessed online at <http://www.wiltshire.gov.uk/planning-new>.

If there are restrictions on the hours of operation and you plan to open beyond this you will need to submit an application to vary the condition. You should be aware that the community will be more sensitive to noise after 23.00 hrs and before 07:00 hrs and additional control measures may be required if the new business will be producing noise during this time. This needs to be addressed in the planning application.

General Permitted Development

Permitted development rights have temporarily been extended under the Town and Country Planning (General Permitted Development) (Amendment) (England) Order 2018. In accordance with this Order the Environmental & Control Protection Team is no longer consulted on the full range of environment issues which may be caused by or associated with such a change of use.

Those who wish to utilise these new rights are advised that, notwithstanding the Town and Country Planning (General Permitted Development) (Amendment) (England) Order 2018, you have a duty to ensure that:

- i. The occupants of the development are adequately protected against environmental issues or emissions which exist in the area of the development; and
- ii. Those living or working nearby are adequately protected from environmental issues or emissions caused by the development or use thereof.

There are a wide range of environmental issues or emissions which may affect the health or wellbeing of other local residents or businesses including the environmental factors that are considered in this guidance document. These issues or emissions can be present in the local environment generally or can be caused by specific activities or operations taking place nearby.

You must consider whether your development will be affected by, or will cause, any of the environmental issues mentioned in this document, air quality and contaminated land. If so you must take the appropriate steps to ensure that both the future occupants of your development and those living or working nearby are adequately protected. Where it is not possible to take steps to prevent, or protect people from, these issues you should reconsider whether the change of use should take place.

If the change of use is to change or introduce a business activity and that business activity subsequently causes a “statutory nuisance” the advice given in this document may affect that business’ ability to claim any statutory defence of “best practicable means” in any action taken against it under the Environmental Protection Act 1990.

By addressing these issues before the development takes place you will reduce the risk of any adverse effects, and reduce the chances of the local authority using its enforcement powers in the future to resolve the problem.

DEVIZES CONSERVATION AREA STATEMENT

September 2005

Planning Services

Development Control & Conservation

Forward Planning & Transportation

Building Control & Property Management

Devizes is a town with a remarkable architectural and historic legacy. The pattern of streets and spaces still reflects the organisation of the Norman castle and this, together with the 500 or so listed buildings, provides a town centre of individuality and distinction.

The range of historic buildings, particularly from the 15th century, includes many of high architectural quality. Variations in the use of materials and details create interesting and attractive streets and there are many occasions where the quality of craftsmanship sets a standard that regrettably is no longer achieved.

The character of Devizes depends on its buildings and spaces, landscape setting and trees, and uses. Commercial activity in the town centre is an integral part of the town's character and its attraction needs to be maintained.

Creative conservation is all about managing change. This Statement is not intended as an exercise in preservation - its main purpose is to ensure that the significance of the architectural and historic heritage of Devizes is fully recognised and is taken onto account in making decisions about the future of the town.

DEVIZES CONSERVATION AREA

The quality of the Devizes Conservation Area is in the layout of streets, spaces and historic buildings. Also the variety of styles of architecture and scale and juxtaposition of buildings.

The purpose of this Statement of the Devizes Conservation Area is to identify and record those special qualities of the town that make up its architectural and historic character. This is important for providing a sound basis for local plan policies and development control decisions as well as for the formulation of proposals for the preservation or enhancement of the character or appearance of the area.

The Statement contains an assessment of the Devizes Conservation Area and is intended for all those with an interest in the town, or undertaking work on its buildings, landscape, streets or public spaces. It is also essential reading for anyone contemplating development within the town. By drawing attention to the distinctive features of Devizes it is intended that its character will be protected and enhanced for the benefit of this and future generations.

The Conservation Area was first designated on 26 November 1970 and extended on 27 October 1977 so that it now covers the whole of the town centre. The northern boundary follows a section of the Kennet and Avon Canal and then runs southwards around the outer wall of the Castle and following the line of the former railway, cutting back along Southbroom Road and the eastern side of The Green. The boundary then turns to the north-east of St. James's Church, and back just north of Estcourt Street and north-westwards along Commercial Road, to The Wharf.

The main characteristics of the Devizes Conservation Area are:

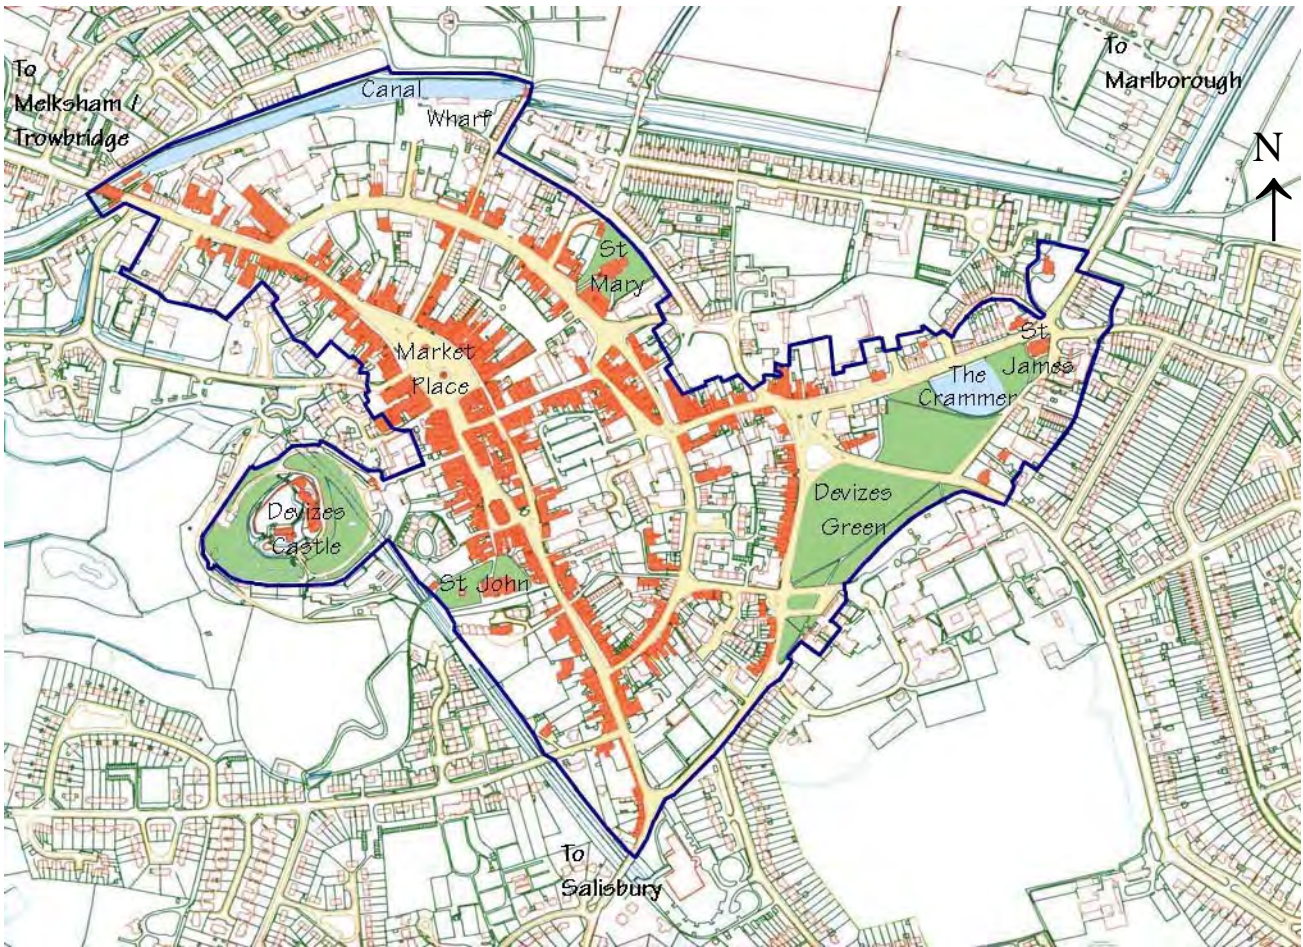

At a closer look many of the buildings in the Conservation Area are intricately detailed with a high quality of design, materials and craftsmanship.

- A unique town plan based on the layout of the Castle and the Norman origins of Devizes
- A remarkable collection of historic buildings dating from the 15th to the 19th centuries with a number of especially high quality 18th century buildings
- A town market place almost entirely surrounded by listed buildings and including historic monuments
- Attractive vistas along historic streets frequently terminated by buildings of high quality
- Two especially fine churches of Romanesque origin, St. John originally located within the confines of the Castle to serve the garrison and St. Mary outside to serve the townsfolk
- Public open space in the form of Devizes Green together with The Crammer
- A small section of the Kennet and Avon Canal including the Wharf

The history of Devizes relates directly to the Norman Castle, the siting of which is fundamental to the layout and setting of the town. This has defined the street pattern, most of which has survived. The visual impact of the present Castle on the town centre and the Conservation Area is limited by its comparative seclusion.

DEVIZES CONSERVATION AREA

Devizes Conservation Area with the listed buildings marked in red. This map shows the overall form of the town and the relationship between the castle and the subsequent layout of streets.

Geology and topography

Devizes is geographically at the centre of Wiltshire and has a population of around 15,000 in the urban area. It is approximately 20 miles east of Bath and 20 miles south of Swindon. Chippenham is 10 miles to the north-west and Salisbury 26 miles south. The A361 running east-west from Swindon to Trowbridge passes through the town.

The town is located at the western lip of Pewsey Vale which separates the Marlborough Downs and Salisbury Plain. The town is built on more or less level ground to the north and east of the Castle at around the 130 metre contour and sits on a plateau of Upper Greensand at a point where several platforms of greensand line the western edge of the Wiltshire chalkland. The land falls away sharply to the south towards Salisbury Plain and to the west, as can be seen at Caen Hill. Gault clay extends from the west in two dry valleys almost up to the Castle walls.

Devizes is also at the division of the Bristol and Salisbury Avon river systems of Wiltshire and, being at the watershed, had a limited water supply with virtually all drinking water obtained from wells within the town. This situation was slightly eased in 1810 by the arrival of the canal but it was not until 1877 that a water supply was piped in from the east.

Origins and development

One of the earliest surviving buildings - the impressive view of St. John's Church seen from Long Street.

In the street scenes St Mary's Church mostly appears behind other buildings and is only seen in its entirety from the churchyard.

Although Great Porch House dates from the 15th century many of the external features such as the Georgian sash windows are later.

The historical content of this Conservation Area Statement is intended to show the links between the town's history and present day streets and buildings. The original plan and layout of the town and the subsequent pattern of growth are major influences on the character of Devizes and these links need to be recognised as the starting point for considering the form and scale of future change.

The Statement is not a definitive history of the town: the history of Devizes is well documented and a selected list of books on the subject is included in the Bibliography.

Origins

The development of Devizes starts with the Castle. It is possible that the Castle's history began with an Iron Age hillfort but our starting point is the wooden construction in 1080 by Osmund, Bishop of Salisbury. His castle, built on the boundaries of his manors of Potterne and Cannings and the King's manor of Rowde, was known as 'castrum ad divisas' - the castle at the boundaries. The site was easily defended with the Castle built on a spur of land with three sloping sides and a link to the plateau to the east.

The timber castle burned down in 1113 and was replaced in stone by Osmund's successor, Bishop Roger of Caen. The Castle played an important part in the Civil War of 1139-1141 and the reward to the townspeople of Devizes for their support in winning back the Castle for The Empress Maud was a Royal Charter of 1141 guaranteeing traders freedom from market tolls throughout the land. A further Charter of 1218 gave the burgesses of Devizes a large measure of local jurisdiction and underlined the increasing significance of the town.

The town grew to support the Castle although the expansion was restricted by the topography to the level area of land east of the Castle. The plan form of Devizes, which has more or less remained intact to the present day, is based on the concentric lines of castle defence.

Economic activity in the town was encouraged by the Charter and in the early 14th century the tradesmen seemed to be mainly leather workers although later there are references to metal workers. It was not until the 15th century that weavers and clothiers became prominent.

Early buildings in Devizes are the Churches of St. John and St. Mary. St. John's is an important Norman church with an impressive rectangular crossing tower and an attached round stair turret, built to serve the Castle. St. Mary's also has a Norman chancel and dates from around the same time as that of St. John.

The Church of St. James, Southbroom, is first mentioned in a document of 1461 and was, until the 19th century, a Chapel of Ease for the parish of Bishops Cannings. The building of St. James's Church marks a stage in the growth of the town when the population was no longer forced to shelter within the Castle ramparts.

The market recorded in 1228 was in a wide space south of St. Mary's Church and market trading increased in importance as the town developed.

In medieval times the buildings of Devizes were timber frame, probably with wattle and daub infill, as still can be seen in St John's Alley. Limestone paving setts complement the buildings.

As the military importance of the Castle declined there was less need for strong defence and by the 14th century there was evidence that the outer bailey walls had been breached and redevelopment had taken place within. It was therefore possible for the tradesmen to make use of the open space of the outer bailey. This area became known as the New Port with the former market place known as the Old Port. The new street then laid out between the north and south gates of the town included what are now Northgate Street, Market Place and Long Street. Infilling at the south-east end of the Market Place by the 15th century produced St John's Street and Wine Street. Just beyond is St. John's Alley, once linked to Wine Street, where medieval buildings still survive. Great Porch House in Monday Market Street is another early building with origins dating from the 15th century.

16th Century

The 16th century saw the considerable growth and influence of the administration of the Borough by the Mayor and Burgesses. This was evident in the supervision of trade, including the maintenance of standards and the registration of apprentices and in the various aspects of public interest such as health, housing, highways and poor relief. The Borough was also responsible for a considerable amount of property. The other major role for the Borough Council was as a Court of Law.

Evidence of 16th century buildings survives at the southern wing of the Bear Hotel and behind the later frontage of the Four Seasons in High Street. The Three Crowns PH in Maryport Street also dates from the 16th century. Buildings in St. John's Alley date from the early 16th to mid 17th century and still illustrate the architecture of the time.

Steep pitch gables facing the street are characteristic of 16th and 17th century building represented here at the Three Crowns PH. Form and scale is in marked contrast to the 20th century building alongside.

17th Century

Limited development continued in the 17th century and buildings, or remains of such buildings, from this time can still be found in a number of streets. These early houses were constructed of timber frame with wattle and daub infill and probably had thatched roofs. Characteristics of the 17th century are gables facing the street and steep pitched roofs such as can be seen at the restored Elm Tree Inn. This and other gable fronted buildings give an impression of how the town would have looked at the time. 17th century remains survive at 39 New Park Street, and at 6-10 The Island. Much of Long Street has 17th century, or earlier, origins and 4 St. John's Court has a medieval core behind a late 18th / early 19th century stone front.

Detailed investigations are needed to determine the exact dates of buildings and further studies may reveal a more accurate picture of the town at this time, particularly as knowledge is accumulated and investigative techniques become more sophisticated.

18th Century

The 18th century was a time of economic prosperity for Devizes, evidence of which can be seen in many of the town's fine buildings. A rebuilding programme began around 1700 and was to continue for the next 150 years or so changing the character of Devizes from medieval to the various phases of Georgian. Building lines and streets were largely unchanged but many houses were rebuilt and others refronted.

There are a number of 18th century buildings in the Market Place. Number 17 in brick on the south side and Parnella House in stone on the north are examples of particular quality. The Brewery dates from 1885.

Brownston House is one of the high status buildings of Devizes and is typical of the style and materials used in the 18th century. Gates and gatepiers complement the setting.

Much of this prosperity was based on cloth and other industries but was also due to the location of the town on one of the major routes to Bath which saw Devizes develop as a coaching town. During this time market activities continued to expand and Devizes was seen as having one of the best markets in the west of England. This economic activity encouraged various professions to the town bringing with them the need for good quality buildings, although the lack of a supply of running water for industry, power and transport undoubtedly constrained the development of the town.

Georgian architecture in Devizes occurred as new-build or re-fronting of existing buildings giving the town a strong Georgian character. Brownston House in New Park Street and 17 Market Place are high quality 18th century brick buildings, now listed grade I, and Parnella House is another fine 18th century building, this time in stone. Many of the houses in Long Street were refronted in both brick and render and this gives the street a most attractive Georgian character, although in a number of cases hiding much earlier buildings.

The attractive 19th century stone entrance to the Museum between 18th century brick buildings introduces variety and interest to the street scene.

Also towards the end of the 18th century the Devizes Improvement Commission began to clean the streets and erect lamps and pave certain routes. Trading encouraged travel and brought with it the need for accommodation. In 1776 the town had 41 inns and alehouses, 26 in the New Port, 11 in the Old Port and 4 on The Green. Some of these, including The Bear, could be traced back to the 16th century and former sites are commemorated in street names such as Old Swan Yard.

Although in 1637 there was a regular journey made by carriers from Devizes to London, the improvement of roads created the opportunity for longer and more frequent journeys. A Devizes Turnpike Trust was established in the early 18th century and the works undertaken encouraged increased passenger and goods transport. Devizes had its first turnpike road in 1706 and by 1753 a complete route had been opened up from London to Bath by way of Marlborough and Devizes, although the main route was the Great West Road that ran from Marlborough to Chippenham.

Longs Stores in New Park Street, the former Anstie's Mill, built in 1785 is one of the earliest factory buildings in the south-west of England. This prominent industrial building used as a silk mill, and later for snuff and tobacco, is a now converted to residential use.

19th Century

The position of Devizes led naturally to its establishment as an administrative and service centre with new buildings constructed to serve this role. Public buildings erected included the Town Hall of 1808, the former Assize Courts in Northgate Street and the Market Hall, both of 1835. The Market Cross, a distinguished monument in the Market Place, is 1814.

The Market Hall of 1835 is one of a number of buildings that demonstrate the prosperity of Devizes in the 19th century.

The completion of the canal in 1810 was another major influence on Devizes, not only because of its effect on the layout and economic activity of the town but also by providing the ability to move building materials such as Bath stone and Welsh slate thereby influencing the architecture of the period. The stone bridges over the canal together with the buildings at the wharf are integral parts of this legacy.

The Corn Exchange, 1857, is notable for its imposing front and contribution to the townscape of the Market Place. The fashion for buildings of style can also be seen at Lloyds Bank in the Market Place. The building dated 1892 and designed with early Georgian and 17th century motifs represents a high point in the quality of building. Handel House in Sidmouth Street and the Northgate Brewery of 1885 are other landmark 19th century buildings.

Nonconformist churches and chapels date mostly from this period although the former Congregational Church in Northgate Street was enlarged from a building of 1776. The Baptist Chapel in Sheep Street is 1851-2 and the Maryport Old Baptist Chapel 1780 but enlarged 1818. The Salem Chapel in New Park Street is 1838. The Methodist Chapel in Long Street was opened in 1899.

Devizes in 1900 showing the remarkable survival of the compact town plan. The Conservation Area covers the whole of the historic town centre including most of the buildings shown on this map.

These late 18th and early 19th century brick and stone houses at Southbroom Terrace enjoy an open aspect over The Green.

In the mid-19th century the arrival of the railway brought about increased industrial and commercial activity and led to a steady expansion in the population of the town. This was reflected in new housing in Bridewell Street, Sheep Street and Southbroom and in rebuilding and infilling within the town centre. Burgage plots were subdivided, the medieval Brittox widened, and many timber-framed buildings replaced. Much of the rebuilding was a direct consequence of the establishment of another Improvement Commission this time in 1825.

20th century

As with many towns across the country there was relatively little development and change in the early part of the 20th century. The effects of the First World War and the general economic circumstances of the time reduced the amount of activity and investment and many areas and buildings fell gradually into decline.

Buildings in Sheep Street on either side and across the road from the New Baptist Chapel of 1851-2 are mid to late 20th century and relate to the architecture of the period.

By the end of the Second World War a view was taken that action was required to improve the town and particularly to provide better living conditions for its inhabitants. In the 1960s a number of buildings in the town were demolished and replaced.

The largest scheme was demolition and redevelopment in Sheep Street where houses were replaced by three and four storey flats. Frontage cottages and rear courtyard groups were swept away to accommodate the new housing and places such as Jeffries Court, Royal Oak Court and Alexandra Court are names long forgotten.

Close by there was later redevelopment in Hare and Hounds Street, including Sutton Place and Tylees Court. Other 20th century building can be seen in Maryport Street (Tesco), the County Library, Job Centre and former Post Office and the row of shops and flats at the Maryport Street junction with New Park Street.

The growing use of private cars in the post-war period was one of the factors leading to the closure of the railway in 1966. The station buildings were subsequently demolished providing space for the Station Road car park, located just outside the Conservation Area.

A number of shops in the town are post-war buildings designed with varying degrees of success. Some of the 20th century buildings in The Brittox fit more comfortably into the pattern of the town than such buildings elsewhere as here in Maryport Street.

Prominent mid/late 20th century developments occur along New Park Street where the former filling station east of Wadworths Brewery and other facilities to serve the motorist, such as the tyre depots and car sales areas, are in marked contrast to the architecture of their surroundings. Similar large-scale redevelopments are the warehouses for the brewing industry, one adjoining Wadworths Brewery and another in Northgate Street.

After many years of neglect the canal and wharf were brought back into use largely due to the initial efforts of the Kennet and Avon Canal Trust and the canal was formally reopened in 1990. Similarly from 1975 there was significant financial input from the local authorities to encourage the conservation of historic buildings in the town centre. Around this time a number of derelict buildings were rescued including the important medieval structures in St. John's Alley. Further details on the contribution made to the character of Devizes by the Devizes Historic Buildings Joint Committee are included as Appendix 2.

Accommodating large vehicles remains a problem. In Estcourt Street there are a number of places where the frontage has been interrupted to provide new access.

Later in the 20th century infill residential developments were undertaken such as the construction of dwellings in the grounds of The Ark behind the Museum in Long Street and at Castle Court south of St. John's Street.

It is impossible to ignore the effects of the motor vehicle on the town centre as major changes were made to accommodate both moving and parked cars. The most obvious alteration was the removal of buildings and construction of a new section of road at the south end of New Park Street to divert through traffic through Gains Lane and away from Monday Market Street and Sidmouth Street.

Demolition was also undertaken in other parts of the town to provide car parking for shoppers and visitors and more recently traffic management schemes have been introduced including work in the Market Place.

Many of the 20th century changes in Devizes occurred outside the town centre with major expansion of both residential and commercial areas.

Archaeological significance

A number of individual buildings and courtyards in the town have been demolished for redevelopment or cleared away to make space for car parking and have provided the opportunity for archaeological investigations.

The evidence for prehistoric settlement in the area of the modern town of Devizes is slender at best and a few Neolithic flints have turned up south of the town. In the Roman period there was a villa at the base of Roundway Down and Roman pottery and coins have been found across the area south and east of the medieval town. Other evidence of Romano-British activity has been found at Southbroom and at Pan's lane. Although there were several Saxon settlements around Devizes only two Saxon finds are recorded from Devizes itself, both from outside the study area.

The Castle would initially have been a wooden construction but this burnt down in 1113 and was rebuilt in stone between then and 1121. Nothing remains of the first Castle although the early ditch found in excavations at the Corn Exchange in 1994 was probably part of the defences. The outer bailey defences have been examined in several places and are better known. The ditch was roughly 8 metres wide and 4-5 metres deep and has been observed in three separate locations, Estcourt Hill, the rear of 33 Market Place, at Vales Lane and most recently at Snuff Street to the rear of 27/28 Market Place.

Archaeological evidence for the following centuries up to 1750 is fragmentary. The levelling of the Castle rampart probably took place after the Civil War or even after 1723, at which time Stukeley's drawing of the town shows a substantial rampart standing in the area of Castle Lane. Other excavations within the town provide evidence of post-medieval work.

Industrial archaeology in Devizes is focused on the Kennet and Avon Canal and the former railway. The most significant industrial buildings to survive in the town are the former Anstie's Mill (Longs Stores) and Wadworths Brewery. Numerous archaeological features have been recorded from the 18th and 19th centuries.

Sites for new buildings within the centre will provide an opportunity for additional knowledge of the town's history to be obtained and archaeological investigations are likely to be required before construction is undertaken.

Architectural and historic character

The townscape quality of Devizes is exceptionally high with long street frontages of historic buildings and well-defined urban spaces. The character of the town is not uniform and variations can be identified based on the relationships between buildings, roads and spaces and on the dates of development and consistency or variation in the architecture. The divisions between the boundaries merge and are not hard lines.

The areas identified in this study are:

1. The Market Place
2. Northgate Street and New Park Street
3. St John's Street, High Street and Wine Street
4. Long Street
5. The Brittox, Monday Market Street and Maryport Street
6. Bridewell, Sheep Street and Hare & Hounds Street
7. Southbroom Road and the Green
8. Estcourt Street, St James Church and The Crammer
9. Southgate Street
10. The Canal and Wharf
11. The Castle

The key elements identified in each of the sectors defined above are intended to highlight the main items of interest. The layout of streets and spaces throughout the Conservation Area is of considerable historic significance because of the way the plan of the town is based on the layout of the original Castle. In addition some 500 listed buildings make a major contribution to the quality and character of Devizes, as do many of non-listed traditionally built structures.

For obvious reasons the photographs used to illustrate this report were taken on bright days but it should be remembered that the character of an area changes from day to night and across the seasons.

The Market Place

The Market Place is the focus of the town and is an especially attractive space almost completely surrounded by historic buildings, a number of which are also of considerable architectural interest. The buildings are mostly three storeys in height giving a pleasing uniformity to this part of the town, although dates of construction and building materials vary creating interest within the overall picture. Rooflines, chimneys and monuments produce a varied skyline.

© Crown copyright. All rights reserved Kennet
District Council 100017656
2005

Key elements are:

- The size and shape of the Market Place, its historic use as a town market and the relationship between the space and the buildings around it.
- The importance of the Market Place as an integral part of the economic and commercial life of Devizes.
- The alignment of roads into and out of the Market Place which brings certain buildings into prominence, in particular Wadworths Brewery looking north-west and the former Cheese Hall (now Cheltenham and Gloucester) to the south.
- A remarkable collection of historic buildings of varying dates.
- Features in the Market Place - the Market Cross and the Fountain
- Trees as a counterpoint to the fine and varied architectural facades.

There are a number of key buildings in the Market Place, in particular the Corn Exchange, the Bear Hotel and The Shambles. Other buildings recognised as of special architectural interest are the grade I listed 17 Market Place and Parnella House.

For much of the daytime the open character of the Market Place is obscured by parked and moving vehicles including service vehicles and buses. The two important historic features here are the Fountain, erected in 1879 in memory of T. Sotherton Estcourt, the town's MP in the mid 19th century, and The Monument that carries the legend of Ruth Pearce. The trees around the Fountain and the street lights rise above the building outlines and become part of the skyline. The Market Place, including the cinema, is the main centre of evening activity in the town.

Northgate Street and New Park Street

© Crown copyright. All rights reserved Kennet District Council 100017656 2005

There is considerable traffic movement through Devizes on the east-west axis, most of which travels through these streets and has an influence on their character. The domestic buildings along the north side of Northgate Street are relatively small in scale which gives greater emphasis to the former Assize Courts and Wadworths Brewery. Buildings on the south side of Northgate Street have a higher status, especially Northgate House and Sandcliffe.

Within New Park Street are a number of sites that detract from the quality of the Conservation Area, these being:

- A The car park gap site
- B the former filling station east of the Brewery
- C the tyre depot at Wharf Street
- D the former auction rooms
- E the vehicle sales opposite Longs Stores
- F the Health Clinic and associated parking area
- G the Iceland block at the junction with Maryport Street

© Crown copyright. All rights reserved Kennet District Council 100017656 2005

Key elements are:

- The historic alignment of New Park Street in relation to the outer bailey of the Castle
- Individual buildings of architectural and historic interest, in particular the former Assize Courts, Northgate House, Wadworths Brewery, Longs Stores, Brownstone House, St. Mary's Church (behind the frontage) and the Castle Hotel
- Northgate Street being the main route into the town from the west

New Park Street is now used as a through route for passing traffic. The architecture here is varied with a number of historic buildings of quality. Interspersed between the frontage buildings are mid to late 20th century developments, many of which are set back from the road and thereby create a visual break in the street scene. The curve of the street presents a constantly changing picture.

St John's Street, High Street and Wine Street

© Crown copyright. All rights reserved Kennet District Council 100017656 2005

The important historic focus in this area is St. John's Alley where medieval structures can still be seen, although the Alley is secluded and often missed by the casual visitor. St. John's Street, running north from Long Street to the Market Place, provides an attractive route into the town centre with historic buildings on both sides. To the west is the access to the Castle although the Castle itself is hidden from this view. Looking south the key buildings are the former New Hall, the Town Hall of 1806-08 (prominent where the road swings past the building and into Long Street), and St John's Church, which is seen in the vista along St John's Court.

© Crown copyright. All rights reserved Kennet District Council 100017656 2005

Key elements are:

- The medieval origins of the area as seen in St John's Alley and St John's Court
- The close-knit character as defined by narrow streets and some relatively tall buildings
- The glimpses of Devizes Castle from St John's Street
- Devizes Town Hall and its setting
- Views to the Church of St John the Baptist along St John's Court
- The tranquil atmosphere of the churchyard and the quality of surrounding buildings

There are interesting building relationships in High Street. Looking from the south there is a remarkable difference in scale between the Elm Tree, the Four Seasons and Greystone House. Efforts were made in 1971 to integrate the supermarket into the street scene by breaking up the front elevation and this is rather more successful than some of the 1960s development in the town. Also in the High Street is the attractive 1991 development of Old Swan Yard which is successful because of the scale and arrangement of buildings, including the incorporation of a number of historic structures. The traditional stone paving adds to the quality of the scheme.

At the junction of Wine Street with St. John's Street is the decorative *Boots Corner* building which presents an attractive view to both streets.

Long Street

© Crown copyright. All rights reserved Kennet District Council 100017656 2005

Long Street is the important historic route running south from the Market Place to Salisbury. On both sides of the street are almost continuous rows of listed buildings, a number dating from medieval times. The character of the street is however determined by work undertaken in the Georgian period. Evidence shows that many buildings from the 17th century (or earlier) have been refronted, and in some cases enlarged, and this is most evident south of Bridewell Street where there is an especially fine group of Georgian brick elevations.

© Crown copyright. All rights reserved Kennet District Council 100017656 2005

Key elements of Long Street are:

- The alignment of the street and the relationship between the height of buildings, the width of the street and the simple line of the pavement
- A range of buildings of obvious architectural and historic interest including the grade II* listed buildings of Lansdowne House, the Museum and Number 27
- The variation in architectural treatment of buildings either side of the junction with Bridewell Street, those to the north being predominantly 17th and 18th century with rendered fronts and to the south 18th and 19th century and predominantly brick
- St. John's Church and the churchyard which make an important contribution to the character of the Conservation Area but have only a limited impact on the character of Long Street
- A pleasing lack of street clutter

The buildings of Long Street are mainly brick or render with painted timber sash and casement windows. The Georgian fronts usually have parapets thus obscuring roof coverings. Roofs are more prominent on the rendered buildings and are clay tile or Welsh slate. The quality of 18th century joinery is generally high with panelled doors and fanlights. The rendered buildings show an attractive use of colour with an obvious recognition of the effect on the street scene. Colour is often dismissed as simply a matter of taste but in Long Street care has clearly been taken to ensure variety and compatibility.

The Brittox, Monday Market Street, Maryport Street and Sidmouth Street

© Crown copyright. All rights reserved
Kennet District Council 100017656
2005

The layout of The Brittox is directly related to the former Castle and the Victoria County History notes that the road through the outer bailey crossed two bridges "between which in 1380 was a barbican." The name of the street derives from this historic association. The alignments of Monday Market Street and Maryport Street are similarly of considerable historic significance. Sidmouth Street was until comparatively recently the main route to the town centre from the east.

© Crown copyright. All rights reserved Kennet District Council 100017656 2005

Key elements are:

- The historic alignments of the streets, as indicated above
- Buildings of considerable historic interest, in particular Great Porch House which dates from the 15th century
- Continuous frontages of listed buildings especially in Maryport Street and on the southern side of The Brittox

The Brittox was pedestrianised in the late 1970s, the kerb lines taken up and the area paved. The character of the street is therefore derived from its width and the height of buildings on either side together with the buildings at each end that provide a visual stop looking north or south. Buildings along the street vary in date and style ranging from early 18th to mid 20th century.

Buildings that detract from the quality of the Conservation Area are:

- A The 1960's development in Maryport Street opposite The White Bear
- B The Tesco Store
- C The former Job Centre and Post Office on the corner of Sheep Street
- D Indicates the Devizes link road constructed in the 1980s

Monday Market Street is notable for Number 8, Great Porch House, one of the earliest surviving buildings of Devizes, although the street itself is now of relatively little architectural interest. Sidmouth Street and Maryport Street, with almost continuous lines of small shops, have retained much of their historic character. Handel House and the stone buildings of Albion Place are distinguished.

The incongruous part of this area is the 1980's road that was cut through to link New Park Street with Sidmouth Street. The objective was to remove through traffic from Monday Market Street and Sidmouth Street but unfortunately the link was conceived as a road rather than a town street. The open view of the car park and rear of the supermarket are not visually attractive additions to the town.

Bridewell Street, Sheep Street and Hare & Hounds Street

© Crown copyright. All rights reserved Kennet District Council 100017656 2005

Buildings in Bridewell Street are predominantly 18th and 19th century two storey brick with the curved alignment of the street creating an interesting townscape view, the T-junction with Long Street being a good example of this.

Sheep Street and Hare & Hounds Street is an area that has seen considerable change. Much of Sheep Street is 1960s redevelopment where three/four storey flats replaced earlier housing. Redevelopment also took place in the vicinity of Hare & Hounds Street in the 1970s. The scale and form of Sheep Street does not relate to historic Devizes; the buildings have been set back from the street frontages and are geometrically arranged. In contrast the later development at Hare & Hounds Street in part was kept to the original building line and the character of the south side of the street thereby maintained with new housing at Sutton Place and Tylees Court built behind. The historic scale of two and three storey houses can be seen in Bridewell Street.

© Crown copyright. All rights reserved Kennet District Council 100017656 2005

Key elements are:

- The historic and architectural character of Bridewell Street and in particular the range of building on the north side from the junction with Long Street

- The townscape importance of the Baptist Church in Sheep Street

- The intimate and dignified Regency character of Lansdowne Walk, Lansdowne Terrace and Lansdowne Grove

- Small scale development behind frontages such as Albert Terrace

An interesting feature in Bridewell Street is the 19th century Gothic style arched doorway to The Grange. Morris Lane, which provides a pedestrian link between Sheep Street and Long Street, contains the attractive early 19th century Lansdowne Terrace and, to the north, the secluded Regency villas of Lansdowne Grove.

In Sheep Street the County Library of 1968 and the Post Office and Job centre of 1966 are buildings typical of the period. These were built before the Conservation Area was designated and are indicative that unsympathetic modern buildings are detrimental to townscape character.

Southbroom Road and The Green

© Crown copyright. All rights reserved Kennet District Council 100017656 2005

The south-eastern approach to Devizes town centre from Upavon arrives at The Green which is a feature of the town that dates back to medieval times. Today it provides a visual and physical attraction maintaining the historical link with town fairs and at the same time offering an attractive prospect for those buildings that surround it. The Green is an important space much cherished by the town's inhabitants and used for a range of activities from quiet contemplation to events and shows.

With the exception of the buildings on the corner of Hare & Hounds Street most of the houses along Southbroom Road are 18th and 19th century. The buildings form an almost continuous line of development with only slight variations in height and style. To the south they are two storey increasing to three towards the junction with Estcourt Street

© Crown copyright. All rights reserved Kennet District Council 100017656 2005

Key elements are:

- The size and configuration of The Green and the many mature trees
- Extensive and long views across The Green including views to the hills beyond
- The historic origins of The Island - Nos. 6-10 are refaced timber frame buildings dating from the 17th century
- 18th and 19th century brick and stone terrace houses along the west side of Southbroom Road
- Heathcote House on the east side (listed grade II*)
- School activity on the edge of the Conservation Area

The character of The Green varies according to the seasons. In winter the surrounding buildings define the space, whereas in the summer trees become much more dominant. Trees in this area are predominantly lime with a small percentage of London plane, maple and silver birch. Maintenance of The Green is the responsibility of the Town Council.

Small scale features often define local identity and provide a different view of history and the town's inhabitants. Near the Fire Station is the horse trough dedicated to Richard Hickley Gundry *who was kind to every living thing* - OB 1896.

Estcourt Street, St. James Church and The Crammer

As previously indicated, the Church of St James was originally in the Parish of Bishops Cannings and became part of Devizes as a result of boundary changes. Estcourt Street is the road route eastwards out of the town and is therefore a busy traffic route. This area includes the eastern part of The Green.

Buildings to the western end of Estcourt Street are on the edge of the town centre although the construction of the Safeway (now Morrisons) supermarket has tended to alter the centre of gravity of the trading area. Buildings on the north side of Estcourt Street have the attraction of facing onto The Green and The Crammer (in evidence before 1654) and have the benefit of a southerly aspect.

Many of the buildings are painted render and unlike much of the rest of Devizes the majority are unlisted. This should not be taken to indicate that they are of little or no interest. It is more that these are relatively later buildings and therefore ineligible for listing under present criteria.

Key elements are:

- The historic and townscape importance of the Church of St James
- The eastern portion of The Green and the mature trees, especially those shown in the above photograph
- The Crammer - site of the famous "Moonrakers" story
- Views - along streets and across The Green
- The relative calm of Church Walk with some attractive unlisted buildings

In recent times a number of gaps have appeared along Estcourt Street. As can be seen from the 1900 map the Kwik-Fit development replaced earlier buildings where there would have been a greater sense of enclosure. Similarly the service bay and main access to the supermarket have created sizeable breaks in the street frontage. Further east along the street the open character is of a different kind with the combination of the water of The Crammer and the eastern end of The Green provide an attractive setting for the Church and other buildings. The route of the A361 brings considerable traffic to this part of the town.

Southgate Street

© Crown copyright. All rights reserved Kennet District Council 100017656 2005

As the name implies Southgate (like Northgate) goes back to the origins of the Castle and surrounding layout. The Potterne Road south to Salisbury is an important route and Southgate also defines the extent of historic Devizes. Much of what is built beyond is 20th century. The earlier route south was further west via Hartmoor and then on to Potterne.

The small terrace of cottages at Southgate is brick built with clay roofs as is the pub beyond. Tree cover on the east side of the road encloses the view and approaching from the south the open space and tree cover to the Bowling Club is a significant green feature.

© Crown copyright. All rights reserved Kennet District Council 100017656 2005

Key elements are:

- The climb from the south along Potterne Road (just outside the Conservation Area) emphasising the elevated location of the town
- Historic importance as the site of the "South Gate"
- Mature trees and tree groups in the grounds of Southgate House and around the Bowling greens
- The open space of the Bowls Club giving a more rural feel to the locality

Approaching Southgate from the south the road crosses the line of the former railway with brick parapets of the bridge on either side. Arriving at the junction of Potterne Road with Southbroom Road there is an enticing view north as the buildings of Long Street come into view and descend towards the town. In the reverse view from Long Street leaving the town centre the trees provide an important backdrop.

Looking east along Southbroom Road trees and hedges provide enclosure. Further east is the brick and slate Scout Hut of 1919, the semi-detached houses to the south-east side being outside the Conservation Area. Beyond is The Green emphasising the edge of town centre character of this part of Devizes. The mature trees on The Green are prominent in this view.

The Canal and Wharf

The canal and wharf are now the focus of recreational activity both on the water and alongside. Former wharf buildings are in use as the Information Centre for the Kennet and Avon Canal Trust and the Wharf Theatre. A substantial part of the land is used for car parking. There are new houses to the south where a pedestrian link is provided into the town centre.

Building at risk:

A Former Assize Courts

Opportunity areas:

B Lower wharf

C Gas works site

© Crown copyright. All rights reserved Kennet District Council 100017656 2005

Key elements are:

- The canal including the bridges and the lock
- The vegetation providing a green "lung" through the built-up area
- The tranquil atmosphere created by the canal and its setting together with the slow and quiet movement of boats
- The Wharf Theatre and Canal Trust building

From the towpath the views are contained and the curvature of the canal is apparent. The stone bridges enclose the space. Trees on the canal bank and within the cemetery (outside the Conservation Area) are prominent. On the north side is a World War 2 brick and concrete pill box, a remnant of a defensive line constructed in 1940/41. On the south side of the canal to the rear of the former Assize Courts the area has an air of neglect.

The Castle

The impact of Devizes Castle is best viewed from the south where there is a footpath from Hillworth Road. Here it is possible to appreciate the importance of the original Castle as a defensive structure. The present Castle derives from a Victorian conversion to a dwelling (now flats) with the building and grounds in private use.

© Crown copyright. All rights reserved Kennet District Council 100017656 2005

Key elements are:

- The present castle building and associated structures
- The topography and in particular the spur on which the castle stands
- The surviving ramparts that now form the setting to the castle
- Groups of trees planted in and around the castle grounds
- The line of the former railway that ran under the castle and now forms the western boundary to the Conservation Area

By the early 18th century the castle had all but disappeared. Stukeley's drawing of the town in 1723 shows that whilst the motte and ramparts appear to survive, the only buildings to be seen were a pair of windmills, which remained in place until 1840 when they were demolished to make way for the present house. It is believed that the tower of the house stands on the foundations of one of the windmills which itself was built on the base of a medieval tower. West of the Conservation Area and on the lower land below was a medieval Deer Park.

In addition to the castle building and the former ramparts, the site contains a gatehouse of around 1860, various walls which encircle the castle mound, and remains of the original castle including part of the foundations of the original keep.

Viewed from Station Road the castle buildings are completely hidden by the trees and even from Castle Lane there are only glimpses of the building. There is a gateway part way along Castle Walk preventing public access. At this point is the 1960s telephone exchange which is an ugly, flat roofed, concrete frame building that runs through to Castle Lane.

Traditional streetscapes

Streets and spaces in historic towns almost always have an obvious function which makes them look attractive and feel comfortable to walk in.

Historic town centres are places of streets and lanes as opposed to the lower density roads found away from the centres and in 20th century suburban developments. Reference has previously been made to the historic importance of the development of the town centre streets of Devizes and it is significant that changes in direction and alignment bring certain buildings and groups of buildings into prominence. This is evident throughout the town and particularly in the Market Place, New Park Street and St John's Street.

The historic character of the streets is most distinctive where the frontage buildings rise directly from the back of the footpath and form a continuous and often sinuous line. These characteristic back-of-footpath facades frequently frame a view as can be seen at the northern end of Long Street and the junction of Bridewell Street with Long Street, although there are many others. The views of the former Cheese Hall and the present Town Hall looking south from the Market Place are especially distinctive and present real quality to the town.

In Devizes more than in other towns the historic street lines are an essential part of the character of the town and the relationship between the buildings and the pavements is particularly important.

This view of New Park Street demonstrates the importance of the road alignment - buildings on the outside of the curve are part of a continually changing scene.

The relationship between the height of buildings and width of the street determines the character of the spaces between. Narrow streets with relatively tall buildings such as The Brittox and Wine Street have a distinct sense of enclosure, especially where the end views are contained by buildings. Wider streets or spaces with lower buildings create the opportunity for longer views and have a more open character.

Paving materials are an integral part of the town's character with kerbs, slabs, and steps of special note. Natural stone kerbs are extensively used in the town centre streets and are usually Pennant stone. In some places this is matched by natural stone paving, with occasional use of limestone setts such as remain at St John's Court and the entrance to the Churches of St Mary and St John. Paving around the Market Cross and the Fountain is especially noteworthy.

Devizes contains many unlisted buildings of architectural and historic interest - they need to be treated with care with original features (especially doors and windows) retained.

Within the street scenes there are individual elements that enhance the town and add interest. Examples of this are the porches of the Georgian frontages of Long Street and other doorways of note such as the corner entrance to the HSBC Bank. Alongside pavements architectural features such as the stone entrance to the Museum and the gates and railings to Numbers 16 and 17 Market Place are important in the townscape.

The character of the Market Place has been altered by the recently completed traffic management scheme including the welcome renewal of paving. The removal of kerbside parking to the north-east kerbs is a definite improvement and the care taken in the overall design of the scheme is evident, particularly when compared to what was there before. There is some additional visual intrusion with more signs and street furniture and care now needs to be taken to avoid adding to this.

The need for clear signage is an obvious aspect of street design but signs, however well-designed, can cause great harm to the character of an historic street if they are badly sited or of an inappropriate scale.

The attractive combination of Bath stone with a stone tile roof - here in 19th century Tudor style.

Street lighting also makes a major contribution to character because of the visual impact of lighting columns and fittings and the way in which these create the night-time atmosphere. In all cases the siting of street and security lighting and its relationship to building facades is important.

The amount of carved stonework evident on buildings and walls, especially in the Market Place, is a demonstration of the care taken by those who commissioned and crafted the town's buildings and these elements add greatly to the interest and quality of their surroundings.

Building materials and details

Buildings in Devizes reveal the use of a wide range of materials from timber frame in the 15th century to brick and stone in the 18th and 19th centuries and the introduction of modern materials in the 20th century.

High quality brickwork, often with stone dressings, is a particular feature of many Georgian and later buildings in Devizes. The window surrounds here in Long Street are cast imitation stone.

The selection of materials used in building construction comes directly from those easily obtainable at the time. This explains the use of timber framing for 15th, 16th and 17th century building and the later use of brick, stone and slate. In the 19th century bricks were manufactured just outside the town at Caen Hill, and the use of local materials provided a consistency in colour and texture. The opening of the Kennet and Avon Canal in 1810 created an easy route for the importation of Bath stone and Welsh slate.

Much of the timber framing used in the town is now hidden but interesting examples can still be seen at Great Porch House and St. John's Alley. In addition, work recently undertaken at 35 Market Place (*the little house of coffee*) has uncovered a medieval roof structure. Traditional infill to timber framing is wattle and daub, an example of which is evident to the rear of Great Porch House. Infill panels in St. John's Alley are replacements inserted when the buildings were comprehensively repaired in 1988.

The colour and texture of the bricks and the pattern used in construction influence the visual quality of the building. The mortar and jointing techniques used are also significant. This brickwork in Sheep Street is in Flemish bond with overburnt blue headers to provide contrast.

Brickwork forms a significant element throughout the Devizes Conservation Area and there are many good brick or brick faced buildings especially from the 18th and 19th centuries. 17 The Market Place and Brownstone House, New Park Street, are excellent examples of high quality brickwork. There are also examples in the town of "penny joint" brickwork which is a technique of minimising the visual effect of the mortar. The quality of historic brickwork derives from the colour, texture and size of the brick and the bond used, together with the colour and texture of the mortar. The standard of workmanship is an important consideration and it is obvious that standards in Devizes were high.

Stone buildings in Devizes are generally of high status, thus we see, in addition to the churches, stone used in the 18th century at New Hall in Wine Street, Parnella House in the Market Place and the Town Hall. 19th century examples are the former Assize Courts in Northgate Street and the Corn Exchange and The Shambles in the Market Place. Especially distinctive is the considerable use of carved stonework which adds appreciably to the townscape qualities of the buildings. It is significant that when the Museum was opened in Long Street in the late 19th century the decision was made to build a new entrance in stone.

The thick glazing bars of the early 18th century. This building on the corner of St John's Court is timber frame with a rendered exterior and is dated 1740 on the rain water head but there is an earlier structure beneath.

The medieval origins of buildings in Long Street are now largely hidden and the buildings which are not faced in brick are generally rendered and painted. For the most part the buildings now seem to be cement rendered with modern paints. Decorative plasterwork is nowadays a relatively unusual external finish but there is an interesting example at Boots Corner (now Abbey Bank) dated 1912.

Early roof coverings in the town would have been thatch and stone tile and although there are no longer any thatch roofs a number of stone tile roofs survive. Roof coverings on 18th century buildings are mostly clay tile, both plain and profiled. Later buildings are clay tile or Welsh slate and there are only a small number of buildings in the Conservation Area with concrete tiles.

There are few examples of early windows in the Conservation Area as these are frequently replaced with the passage of time. One of the earliest examples is at St. John's Churchyard where the contrast between the stone mullion window of the 16th century and the 18th century replacement sash window can be clearly seen.

The refinement of the late 18th century with slim glazing bars to the sash windows and contemporary wrought iron railings. Ionic columns support the elaborately detailed pediment to the front portico. The finish is painted stucco.

Windows of the 18th century were generally double-hung small-pane sashes, the earlier examples having thick glazing bars and the windows being set further forward, whereas later refinement was to set the windows back and use slender glazing bars. The tradition for sash windows continued into the 19th century and the number of glazing bars reduced as glass sizes increased. Interesting comparisons of this can be seen in the town including New Park Street where No. 76 adjoins the former Long's Stores. The survival of historic windows depends on regular maintenance and where this is not undertaken or where fashion suggests a move to larger glazing original windows have been lost.

Windows will often reveal the date of a building and on occasion the social status and aspirations of the original occupants. Casement windows, often seen as inferior to sashes, are more evident on small cottages and 19th century buildings. Casements have also been used in early buildings as replacements.

Very few early doors survive and for the most part the doors on residential buildings are four or six panel or occasionally eight, the design and complexity of the door reflecting the importance of the building. In many cases front doors are set within a decorative doorcase, as at Greystone House High Street and Heathcote House just off The Green, or within a porch such as at Lansdowne House and No. 27 Long Street. Doors are generally painted and original handles, knockers and other door furniture add interest.

This attractive use of colour in Long Street emphasises the form of the buildings and the plot boundaries, details that are lost once the buildings are all the same colour.

High status buildings were often constructed with matching boundary walls, gates and fences, good examples of which are 17 Market Place and Brownstone House. Railings were once in evidence at the Town Hall where only sections now remain. Other notable gates and railings can be found at the entrances to the churchyards.

Rendered buildings provide an opportunity for the use of colour and there are a number of interesting examples in Devizes. In recent years the lower part of Long Street has been enlivened by some imaginative colour schemes and it is pleasing that the schemes are complementary suggesting care taken by the owners to respect the street scene.

Shopfronts and Signs

Traditional shopfronts and painted fascias add considerably to the quality of the town centre. Colour schemes are important.

The restrained lettering on The Lamb PH is particularly distinctive and an attractive way of advertising.

Fortunately there are not too many examples similar to the above where large fascia boards disfigure the building and obscure first floor windows but where they do occur they are very damaging to the character of the town.

Commercial activity in Devizes has long been an important part of its function and many town centre historic buildings have, over the years, been altered to accommodate trade and industry. In the later part of the 20th century the introduction of new building materials and the growth of corporate identity brought a standardised approach to retailing which has adversely affected the appearance of towns and cities, including Devizes.

Period shopfronts within historic buildings are nowadays seen as adding to their character, whereas modern shopfronts are often viewed as obtrusive. The reason for this is the tendency to disregard elevational design and stretch shopfronts, and particularly fascias, over the whole frontage of a building leaving the upper floors visually unsupported.

It is perfectly reasonable that national companies seek to use a house style that clearly identifies them wherever they seek to trade but some of these styles are incongruous in historic settings. The retention of the character of the town centre requires recognition of its individuality and this will demand adjustments to the standard approach. Local distinctiveness is a positive asset in attracting shoppers and visitors and should be seen as such.

Devizes contains a number of historic shopfronts. Of particular note are those at 25 The Brittox, 1 Maryport Street, 37/38 St. John's Street and Handel House in Sidmouth Street. An exceptional example is 20 The Brittox where the early 20th century shopfront has a glass frame. This list is not exhaustive and other good examples can be found. In recent years there has been a tendency to replace mid or late 20th century shopfronts with period styles, some of which are not convincing.

There are some glaring examples of incongruous shopfronts visually unrelated to the buildings on which they are placed, similarly, there are out of scale and excessively large modern fascias. Both can dominate a street scene degrading its character and the pursuit of size becomes counterproductive as each trader seeks to compete with his neighbour.

The introduction of new shops away from the main frontages adds interest to the town and good examples of this can be seen at The Ginnell and Old Swan Yard. To be commercially successful there needs to be signs to direct customers and the occasional display board is acceptable. Excessive use of display boards outside properties can however become a problem, particularly where that causes obstructions, as is evident in The Brittox.

Hanging signs are a traditional method of drawing attention to a particular trade and a number of good examples can be found in the centre of Devizes. The most attractive of these are the signs which demonstrate a degree of care and craftsmanship such as painted pub signs or others in painted timber on traditional brackets. Illuminated box signs are a late 20th century invention, the detailing tends to be crude and they generally look out of keeping. Their use is restricted and the signs that are in place pre-date current regulations.

The retention and enhancement of the character of the commercial part of Devizes requires particular attention to the size, scale and detailed design of shopfronts, fascias and hanging signs.

Landscape setting and the contribution made by green spaces and trees

St John's churchyard provides an attractive setting for surrounding buildings and space for tree planting. This is also one of the long distance public views to the castle

There are two areas in the town where the open space is created or enhanced by water - the canal and The Crammer. The trees at St James's Church are both an integral part of the street scene and form a backdrop to The Crammer.

In a number of cases trees frame the view and the south end of Long Street is a good example of this.

Locations within the Conservation Area where the contribution made by trees and green spaces is especially conspicuous are:

- the line of the Canal, including The Wharf
- the churchyards (St John and St Mary)
- The Green, which visually includes The Crammer and the churchyard of St. James's
- Lansdowne Grove and locality
- the bowling club in Long Street
- the Castle grounds

In addition there are a number of street trees and trees in private gardens within the Conservation Area.

The Kennet and Avon Canal forms an attractive green route through the northern part of the town and, although only a small part of the canal is within the Conservation Area, it nevertheless has a significant bearing on the character of the town. Many trees have been planted along the banks and these, together with trees in the cemetery grounds, are especially notable seen from the Wharf.

Trees within the churchyards of St. John and St. Mary are important features. St. John's Churchyard, which lies west of Long Street, also provides an attractive setting to the church and the surrounding buildings and here yew, lime and holm oak dominate. The churchyard of St. Mary has a more secluded character than that of St. John. The church is set behind street frontage buildings and the churchyard only fully appreciated by those who walk through. Tree species vary but yew and beech are of particular note. Publicly accessible green space in the historic core of the town is limited and both churchyards are notable exceptions.

Approaching the centre of Devizes from the east and south-east, The Green provides a large open area both as a setting for surrounding buildings and as a space for recreational activity. The mature trees surrounding The Green are important in defining the character of the area. These are mostly middle age and mature lime, some of which have had to have extensive surgery in recent years. The Crammer between Estcourt Street and Church walk is visually part of this impressive open space.

The construction of the Castle on a spur on the edge of the Upper Greensand provides a clearly defined boundary to the southern side of the town. This edge has considerable tree cover running down the hillside, particularly north-west of the Castle. Whether the Castle grounds were historically wooded is a debatable point but the area has been the subject of a large scale Victorian planting scheme of mixed coniferous and broadleaf species and these trees are now a major and dominant feature of Devizes. This is especially so seen from Hillworth Road, Castle Lane and Station Road.

Between Long Street and Sheep Street the gardens of Lansdowne Grove and the surrounding area contain many large mature trees which form important skyline features visible from many parts of the town. A large redwood, holm oak and copper beech are of particular importance.

Street trees at the corner of Sheep street and Sidmouth Street. The position of street trees and species used need to be selected with care and once planted carefully looked after.

Trees have been a feature of the Market Place since 1875, the existing trees being recent replacements. At Albion Court in Sidmouth Street are hornbeams that add considerable quality to the space and enhance the setting of Handel House. The pollarded limes at Northgate Street and pollarded sycamores at Estcourt Street are in decline. At the eastern end of Estcourt Street two limes and a sycamore form an important termination to the vista.

Problems and eyesores

It is important to recognise that the town centre is by day a centre for commerce and employment and by night and weekends a location for leisure and enjoyment. In Conservation Area terms problems are seen generally as those sites or buildings where uses have disappeared or where **replacement buildings or alterations or extensions to buildings are out of keeping** with their surroundings. Lack of care or attention to public streets and spaces will also be seen as problems.

As with almost every other town, **moving and parked vehicles** are intrusive. The dilemma of commercial activity and car parking is always contentious and there is a balance to be struck between the demands of transport and the protection and enhancement of the character of the Conservation Area. In visual terms car parks present certain problems, either because they have been created from previously developed areas and reveal the rear areas of properties fronting the main streets, or because they open up a gap in otherwise developed frontages.

Repairing the former Assize Courts and bringing the building back into use is a priority. For far too long this has been a blight on the town.

The main east-west route through the town includes New Park Street and here the townscape has been damaged by 20th century development often related to the use of the motor car. The former petrol filling station on the north side together with tyre depots, break up the street frontage but do not provide attractive spaces. This problem is also evident on the south side where there are additional **breaks in the street frontages** at the clinic and the former auction building.

The early and mid 20th century was not kind to Devizes bringing with it **architecture of little merit**. The fashionable style of building was rectangular in both plan and elevation with flat roofs frequently used. Redevelopment carried out at the time did not therefore follow original street lines or building footprints but imposed the 1960s style. Thus we now see the development on the corner of Monday Market Street and New Park Street as incongruous and unattractive, especially when seen from the service areas to the rear. The former Post Office at the junction of Monday Market Street and Maryport Street and the Tesco store to the side are similar. Efforts were made in the High Street to break down the scale of what is now the Somerfield supermarket but the design considerations disregard the rear service areas onto the car park which appear as an afterthought and are unattractive.

The contrast between styles of architecture could not be more apparent. The *Iceland* building looks worse from New Park Street. One day there needs to be an opportunity for rebuilding (or remodelling).

With few exceptions the architecture in Devizes town centre is of exceptionally high quality and needs to be recognised as such. This means that **modern fascias and lettering** will look incongruous, especially where these are large in relation to the building and run close to or above first floor window cills.

Display boards are prominent in various places, especially The Brittox. If used to excess they can be visually unattractive as well as hazardous to pedestrians.

Replacement doors and windows can spoil and devalue traditional buildings. If repair is not possible then accurate copies of the original should be used.

Signs and especially fascias should be designed to relate to the building on which they are located. Traditional painted signs are part of the character of the town - excessively large fascias if removed will often reveal an attractive period detail underneath, as is hinted in this picture.

Direction and warning signs on main roads need to be kept to a minimum and other alterations for traffic reasons need to respect the historic streets. Signs that are redundant or non-essential for safety reasons such as these above should be removed.

The standard of building maintenance within Conservation Areas is in some cases high and in others less so. The Devizes Town Scheme, that ran from 1975 to 2003, (see appendix 2), was an initiative to encourage the careful repair and retention of historic buildings and to improve maintenance standards. Over the years the Scheme made a major impact on the improvement of the **condition of buildings** in the town centre but a few problems remain or new problems have appeared. The most prominent of these is the sad condition of the former Assize Courts where a viable new use is desperately needed. 42 Market Place is another prominent building where action is required. Plans have been agreed for the reuse and repair of the former Beales shop in St John's Street but work has not yet started and the boarded-up building has a depressing effect on its surroundings.

One of the problems arising from the provision of car parks and the construction of the Devizes Link Road between New Park Street and Gains Lane is the **space left over at the edges of sites**. Efforts have been made to enhance with, for example, the planting of an occasional tree but urban design considerations and integration with existing street scenes remain unresolved. Public spaces work well where there is a clearly defined purpose or function. The space left over from a development will nearly always look like an afterthought if not properly designed.

Alterations to listed buildings are subject to control which means that doors and windows are for the most part in keeping. **Replacement doors and windows** are evident in unlisted buildings within the Conservation Area and many of these are poorly related to the original designs for the buildings.

Observations concerning fascia boards and signs on commercial properties have already been mentioned. Equally important in the overall picture are the effects of **public signs and street furniture**. In recent years there has been a tendency to introduce more and more signs, usually to give direction or impose control. The results of this are to clutter the streets and although new signs are added old signs hardly ever seem to be taken away.

Service cables on street elevations can be unsightly. In some locations overhead cables are also conspicuous.

Preservation and enhancement

Preservation and enhancement can be achieved by control or by positive action and both are equally important. Protection of the character of the Conservation Area depends on all who undertake work in the town either as owners, occupiers, the Town and District Councils and other service providers. Owners and occupiers of land and buildings have the ability to enhance the area through their direct activities, some of which may require planning permission or listed building or conservation area consent.

The District Council is responsible for planning control, and preservation of the character of the Conservation Area is a statutory duty. Work carried out within the highway, undertaken by those providing electricity and telephone supplies, can affect the quality of the environment.

Preservation of existing character

The access to St Mary's Church dictated the position of the new buildings on the right with the result that the church is attractively framed in this view from Monday Market Street.

Refronting of buildings in the 18th century did not always relate to the structural form as the fashion was for a designed elevation. These top floor windows at Long Street are blind hiding the roofs behind.

There are a number of locations where trees frame the view but there are others where trees are the view. Mature trees will need to be replaced in due course and replanting programmes need to anticipate this.

It is the aim of the District and Town Councils that the character and appearance of the Devizes Conservation Area should be preserved and there are various ways in which this can be achieved. The following list is not exhaustive but is intended as a guide to the type of work that would contribute to maintaining the quality of the town.

Action by the District Council:

- Applications for planning permission and conservation area consent to be assessed with reference to this character appraisal.
- Advice to be made available to owners of historic buildings, listed and unlisted, to encourage good standards of maintenance and repair and the retention of original materials and details.
- Establish formal liaison with the County Highway Authority, and involving the Community Plan Transport sub-group, concerning the need for careful design of any works within the Conservation Area and a reduction in the number and sizes of highway signs.
- Proposals for selective tree planting to be encouraged, especially in locations where mature trees will in due course need replacement.
- Recognition needs to be given of the importance of surviving historic detail. Historic street lines are an essential part of the character of the town and the relationship between the buildings and pavements is particularly important. Paving materials are an integral part of the town's character with natural stone kerbs, slabs and setts of special note. The Council will seek to ensure that such elements are retained.

Action by owners:

- All potential changes to buildings and surroundings need to be seen in context. Those seeking planning permission or listed building consent should ensure that their schemes take into account their setting and are shown together with their immediate surroundings. Where new construction is involved take particular care in the choice of materials and quality of work.
- Repair rather than replace original features: where undertaking alterations to doors and windows on traditional buildings copy original styles and details.
- When considering maintenance or re-decoration do not necessarily follow what has been done before but look to see if the appearance of the property can be improved.

Devizes Town Council has responsibility for a number of historic buildings. Repairing the Corn Exchange and giving it a new lease of life is just one of its many conservation projects undertaken in recent years.

Enhancement

Where areas or features in the Devizes Conservation Area are out of keeping with the character of the town it will be desirable to seek improvements or undertake replacements. The way to achieve enhancement is to recognise and respect the intrinsic character of Devizes, design accordingly and undertake all work using appropriate materials and details. There is considerable potential to enhance the area in particular the following:

The canalside area behind the Assize Courts is an enhancement opportunity.

Swan Yard is an award winning example of sensitive remodelling and infill development completed in 1991. The timber framing is based on an earlier framed building in this position but is not a copy.

Parking signs are a present day necessity, using the post box does at least avoid yet another signpost.

- Major redevelopment opportunities for mixed and civic uses exist at The Wharf (former Gas Works site) and the North Gate, for which a Development Brief has been approved. In addition, there are a number of smaller sites where redevelopment would be beneficial. For the most part these are the areas that were developed in the 1960s when concern for architecture and the quality of building was at an all time low. Examples of such development are the "Iceland" block on the corner of Maryport Street and New Park Street and the Health Centre and tyre and car sales depots also in New Park Street.
- Traffic in Devizes is a key issue and the impact of both moving and parked vehicles has a detrimental effect on town streets. Traffic calming has been implemented in the Sidmouth Street/Maryport Street area but is not visually successful. There is an excessive use of bollards and the block paved ramps and raised areas are showing signs of premature failure. Signs and other items of street furniture related to traffic movement are frequently too large, too many and obtrusive. An audit of signs with the intention of removing all those that are non-essential would be of considerable benefit.
- The condition of many of the buildings in the centre of Devizes has been improved in recent years, in some cases very significantly. Much of this results from the Devizes Town Scheme initiative which was set up in 1975. The cumulative effect of a small number of projects year by year is of benefit to town centre character but further work is needed and continuing maintenance will be required. Repair and reuse of the former Assize Courts needs to be a priority. Reuse and enhancement of 41 Market Place is also required.
- Commercial activity in Devizes is a vital part of its character. Efforts to promote individual business activity appear in the form of fascias and other signs, together with display boards. A balance needs to be achieved between the desire to maintain and enhance visual character and the promotion of economic activity. It is not necessary for fascia boards to dominate buildings and streets and there is a danger that signs simply get larger and the advertising more obtrusive. Similarly, display boards on the footway can have a useful function provided that they are used with discretion and do not present a danger to the public, especially the disabled.
- Car parking within the Market Place is seen as an essential component of shopping activity and a major scheme to reorganise parking, vehicular and pedestrian movement has recently been implemented, including the provision of bus stops and shelters. For the most part the scheme has recognised the quality of the space although the prominence given to the identification of routes for vehicles has led to areas of paving being built arbitrarily into the carriageway. These together with an increasing number of traffic islands, bollards and line painting are visually obtrusive.
- Paving is important in defining the quality of a street and the improvements carried out in the Market Place are an example to be followed. The priority for future repaving schemes should be Northgate Street, St John's Street, Wine Street and The Brittox.
- Swan Yard and The Ginnell illustrate the kind of changes that enliven the town. Other opportunities, such as the court behind 4-5 Northgate Street, do exist and should be encouraged.

Areas of potential change or future enhancement opportunities

Potential change

Assize Courts
Full repair / new use urgently needed

Lower Wharf

Northgate site

Gas works site

41 Market Place

There are selected locations in the town, notably Sheep Street, where new tree planting would enhance.

More care is needed regarding changes to unlisted building in Estcourt Street and elsewhere

© Crown copyright. All rights reserved Kennet District Council 100017656 2005

Longer term opportunities

Redevelopment of Kwik-Fit site

Create a sense of enclosure on the south side of the link road

Redevelopment of 1960's buildings
Tesco / Job Centre / Post Office

Redevelopment / remodelling of the *Iceland* block

Redevelopment of the Health Centre site

Redevelopment of Hi-Q and Checkpoint in New Park Street

This plan shows only the larger sites - smaller areas of opportunity do exist but cannot be included on a map of this scale

Design considerations

It is highly unlikely that permission would be given today to alter an 18th or 19th century building in this way but equally damaging proposals are sometimes presented to the Council.

Gap sights present a challenge. There needs to be respect for the adjoining buildings and an aim to add to the quality of architecture in the town.

The 1930's infill in the Market Place is usually dismissed as an eyesore but is this the right place for a pseudo period building? Design considerations need to be more than just debates about style.

There is no doubt that Devizes will continue to see large and small scale changes within the town centre reflecting the economic and social circumstances prevailing at the time. Apart from the redevelopment sites already identified there are likely to be new ideas and opportunities, all of which will need to be assessed within the conservation context. Large sites or gap sites provide the opportunity for enhancement provided that a high quality of design and construction is achieved.

How to achieve the required quality will be a matter of debate but it should be an informed debate, not simply a requirement to "be in keeping". The way in which buildings are made to "look right" is in proportion and scale and in the design of doors, windows and other features. The layout and arrangement of floor plans is also significant. The construction of buildings in earlier centuries was dictated by the use of materials such as the length of timber beams but this is no longer a controlling factor.

Recent publications from English Heritage and the Commission for Architecture and the Built Environment, in particular *Building in Context*, emphasise the need for high quality design in conservation areas and provide useful guidelines.

To quote "In final analysis it is true that there is a subjective element in judgements about design quality and people often disagree about what they like. Such differences of opinion and matters of taste should not be allowed to obscure the fact that it is possible to arrive at opinions about design based on objective criteria." These include:

- The relationship of the building to its site
- The relationship of the building to its wider setting
- How is the density of the proposal related to that of existing and neighbouring uses?
- The impact of the building in close view
- What materials are used? How do they relate to those of surrounding buildings?
- Is the architecture of the building suitable for the uses it contains? Is it trying to be too grand or pretending to be more modest than it really is?
- How does the architecture present itself to the viewer?
- What contribution, if any, does the proposal make to the public realm? If new open space is created, is it clear that it will provide a positive benefit and have a genuine use?
- In the wider setting, has the impact of the building in views and distance been considered? Does it make a positive or negative impact? Does it detract the eye from the focus of the view and, if so, does it provide something better to look at?

Specific and complex sites will require particular consideration but where there is any redevelopment potential within the Conservation Area the opportunity should be taken to reintroduce missing street frontages. In such cases the relationship to adjoining buildings and factors such as height, scale and use of materials are major considerations.

The planning context

An interesting example of the scale of development over the centuries. To the right of the Market Cross (1814) the coffee shop gable end is 17th century and is in marked contrast to the 18th century building next door. Lloyds Bank is 1892.

The Planning (Listed Buildings and Conservation Areas) Act 1990 places a duty on local planning authorities to determine which parts of their area are "Areas of Special Architectural or Historic Interest, the character or appearance of which it is desirable to preserve or enhance" and to designate them as Conservation Areas.

The Act, and Government advice given in Planning Policy Guidance Note 15, Planning and the Historic Environment, states that the local planning authority should formulate and publish proposals for the preservation and enhancement of all Conservation Areas and this assessment, published as the Devizes Conservation Area Statement, is part of the process.

This Conservation Area Statement was adopted by the Council as Supplementary Planning Guidance on 8 September 2005. SPG provides additional information on the interpretation and implementation of policies and proposals contained in a Local Plan.

Consultation procedures, consistent with the advice contained at paragraph 4.7 of PPG15 – *Planning and the Historic Environment*, have been undertaken during the preparation of this Statement. Paragraph 3.16 of PPG12 – *Development Plans*, also states that adequate consultation is a requirement for adoption of SPG. The Council considers that the consultation undertaken meets the obligations for consultations set out in PPG12.

The Kennet Local Plan 2001-2011 has been adopted by the Council and became operative on 30th April 2004. This Statement provides detailed background information for the interpretation of the Local Plan, particularly Policies HH5 and HH6.

In addition, the guidance will be relevant to the application of Policies PD1, HC2, HC3, HC5, HC10, HC21, ED8, ED17, ED18, ED19, ED20, ED21, ED22, AT4, AT20 and AT21.

Details are important in the streets and spaces of the town. The quality of these areas and their visual attractiveness depends on the form and alignment of the streets, the position, heights and scale of the buildings and the materials and details used in construction. At first glimpse the details may not be apparent especially above the ground floor. Looking up can often be rewarding.

The Conservation Area of Devizes is complex and, although priority has been given to highlighting the main features, omission of items from the text or from the illustrations should not be regarded as an indication that they are unimportant in conservation or planning terms.

Summary and Conclusions

Summary

This group of buildings at the north end of Long Street includes examples from the 17th, 18th, 19th and 20th centuries. Any alterations will change the character: the challenge is to ensure that any such works are an enhancement.

Devizes is a town with a remarkable architectural and historic legacy but with a few blemishes. The pattern of streets and spaces has survived almost intact for over 800 years and this, together with the 500 or so listed buildings, provides a town centre of individuality and distinction. The range of historic buildings from the 15th century includes many buildings of high architectural quality. Variations in the use of materials and details create interesting and attractive streets and there are many occasions where the quality of craftsmanship sets a standard that regrettably is no longer achieved.

The character of the town depends on more than just buildings and spaces and uses are an important component. The importance of commercial activity in the town centre needs to be recognised and its attraction maintained.

Up until the middle of the 20th century development was concentrated in the town but in recent years, in common with other settlements, the built up area of Devizes has expanded considerably. Within the Conservation Area there are a number of 20th century buildings that are now seen as incongruous and which make little or no contribution to the character of the town. There are also a number of gap sites that present the opportunity for new development.

Conclusions

Creative conservation is all about managing change and the purpose of Conservation Area designation is to draw attention to the quality and character of an area in order to influence future decisions. The Statement is not intended as an exercise in preservation - it is intended to prevent the loss of important parts of our built heritage.

There will be occasions where preservation is a priority. Craftsmanship at the level seen at Lansdowne Grove is not likely to be achieved in future building.

Devizes is a thriving market town and a place of employment and enjoyment. Businesses come and go and this is a natural occurrence in town centres. An important consideration is that new uses should be compatible with the buildings in which they are located and, where alterations are needed, that these respect the character of the building and its wider setting.

There are vacant sites and opportunities for new development within the Conservation Area and these have the potential to add to the interest of Devizes. In this context new schemes should be designed to reflect the form and grain of the town taking into account historic boundaries and overall density.

Adaptation and reuse of historic buildings is an ongoing process of which The Wharf Theatre is just one example. Providing buildings with a new use in an attractive setting is good conservation practice.

The important message of this Conservation Area Statement is the need for all those intending to carry out work in the town which affects its buildings, their settings, open spaces and street scenes, to examine the implications of change and see all perspective alterations within the larger picture. If change and development in the town are to be based on historic forms then it is important to have a clear understanding of period style and detail. Alternatively, it may be more appropriate to seek a 21st century solution that recognises and respects historic precedent but does not try to imitate it.

Retention and enhancement of the special character of the town is for the benefit of existing and future residents, businesses and visitors. The information in this character assessment is intended to assist this process and provide guidance for the future.

Appendix 2 - Devizes Town Scheme

St John's Alley in 1975

Neglect of historic buildings was much in evidence in the 1970's. In addition there were many abandoned upper floors in buildings across the

St John's Alley today

The Devizes Town Scheme was established in 1975 and ran until 2003. Its purpose was to encourage the proper care and conservation of historic buildings by the allocation of grant aid. The scheme, introduced following an appraisal of historic buildings, identified poor standards of maintenance and in some cases dereliction which threatened the town's character and historic interest. 180 buildings were initially included, mainly in the Market Place, but over the next two decades the Scheme was extended to cover some 400 listed buildings in the town centre.

Financial support was provided by the Department for the Environment (later English Heritage) and the County, Town and District Councils and the scheme was a recognition of the contribution made by historic buildings to the economic life and vitality of the town.

A condition of buildings survey undertaken in 1975 revealed a large number of problems including particular difficulties with some of the 16th and 17th century buildings. There was major concern about a group of 16 buildings in High Street, St. John's Alley and St. John's Street that had been acquired for redevelopment and were threatened with demolition. The redevelopment then proposed failed because of an economic recession and all of the buildings were subsequently retained, repaired and brought back into use.

Over the years of the scheme some 100 buildings were repaired and many hundreds of thousands of pounds invested by both public and private sectors. One of the concerns at the time was a need to bring disused upper floors back into use and there are a number of examples where this has been successfully achieved.

Considerable progress has been made since 1975 in improving the standard of care of the town centre historic buildings, much of which can be attributed to the assistance provided under the Town Scheme. Credit must also be given to the many building owners who have themselves made a substantial investment. The conservation of Devizes is however an ongoing exercise and more work remains to be done. Protection of the town's historic buildings is fundamental to retaining Conservation Area character.

Studies undertaken as part of this Conservation Area Appraisal reveal that changes to unlisted buildings within the Conservation Area are often incongruous even though many of these buildings are of architectural and historic interest. They may not meet the current criteria for listing but their contribution to the character of the town should not be ignored, especially where they are in prominent locations. Similarly maintenance is sometimes seen to be incorrectly specified and poorly executed with a damaging effect on the buildings concerned.

The provision of specialist technical advice on the protection of historic buildings is an important function of the Council's activity. An analysis of the work undertaken in the last 20 years indicates that many of the problems of preserving historic buildings in the town result from badly executed alterations and inadequate standards of repair. These together with poor or non-existent maintenance remain a concern. Consideration needs to be given to how these concerns can be addressed.

We have this structure as a substandard bridge and need to start looking at possible mitigation / strengthening measures. The first thing we will do is undertake a further assessment and profile survey; if you know the bridge you'll realise the difficulties in getting a true profile, recent scanning technology should however solve that for us. I was wondering do you have an up to date PBI for the bridge that you would be willing to share, this would save us the expense of getting scaffold / underbridge unit in .

I had our Consultant take a look at this bridge as there were always doubts in my mind about the original assessments. They have concluded that the bridge might / should be rated at 40T, could you have a look at their report and let me know what you think?

Morning Julian

In terms of exams reports – the most recent Detailed Exam report is from 2011 and the most recent Visual Exam report is from 2015. I've attached these. As you can see by the dates, we should be receiving the 2016 VE sometime in the next few weeks, so I can forward that when received.

I'm not sure what your timeframes for work are like, but the next DE will be July/Aug next year, which will obviously necessitate 'touching distance' access, so there may be scope for you to piggy-back onto this or for me to see if the examiners will pick up measurements for you – just a thought.

Cheers

Executive summary

Devizes Castle Bridge carries the unclassified single carriageway, Hillworth Road over the disused Devizes Branch railway line. Highways England own the structure, however Wiltshire Council requested an assessment to determine its provisional capacity.

An earlier assessment report dated May 2002 by Ringway Parkman concluded the structure to have a 3t restricted capacity. This report details the assessment of the structure in accordance with BA 16/97 and BD 21/01, using RING 3.2 and Archie M software. The client requested the assessments were to be carried out using information from the latest inspection reports and a topographic survey of the arch profile. Both assessments concluded a structural capacity for the bridge of 40t ALL, subject to a number of assumptions as detailed below:

- 564mm arch barrel thickness,
- condition factor = 1.0. 12mm uniform loss in barrel thickness to take account of spalling,
- Engineering Brick B in 1:3 Lime mortar (4.2N/mm^2),
- backing ignored,
- and assuming bonded rings.

Without the availability of record drawings or testing information from cores there is some uncertainty as to the adopted characteristic masonry strength. Sensitivity analysis has been undertaken for both methods to determine the level of capacity with a range of assumed masonry strengths. The sensitivity analysis concluded an upper bound capacity of 40t and a lower bound capacity of 12.5t. The structure achieved 40t capacity with all assumed brick strengths apart from 3.5N/mm^2 (wirecut bricks in 1:3 lime mortar) under 11.5t single axle loading, where the bridge was assessed to have a reduced capacity of 12.5t.

From the information available it is uncertain whether the arch rings are bonded. The structural capacity assuming de-bonded rings was concluded to be 3t restricted loading. It is recommended site testing is performed to determine with certainty whether the arch rings are bonded. If de-bonded areas are found, stitching from the intrados of the arch is the recommended remedial measure,

1. Introduction

This report has been prepared by Atkins Transportation. Atkins was commissioned by Wiltshire Council to undertake an assessment of Devizes Castle Bridge, which is located at grid reference SU 005 610 in Devizes, Wiltshire. The purpose of this assessment is to determine the provisional structural capacity using RING 3.2 software and verify using Archie M software. The assessments have been carried out using information from latest inspection reports and a topographic survey on the arch profile.

The structure is a single span brick masonry arch spanning approximately 16.2m, with brick spandrels and brick masonry parapet. It carries the unclassified single carriageway, Hillworth Road over the disused Devizes Branch railway line. The arch structure has a 16° skew with a carriageway width of 6.1m and narrow footways on either side. Following the topographical survey, the arch barrel is uniformly taken to be 0.564m.

An earlier assessment report dated May 2002 by Ringway Parkman concluded the structure to have a 3t restricted capacity. This assessment is deemed to be conservative as discussed in section 5.1.

1.1. Scope of Assessment

The client requested the assessments were to be carried out using information from latest inspection reports and a topographic survey of the arch profile. A topographical survey was carried out in January 2017 by Brunel Surveys Ltd, to determine an accurate profile of the arch. No inspection for assessment was carried out.

As a single span masonry arch of 16.2m span, Devizes Castle Bridge is classed as Category 2. An Approval in Principle (AIP) for this assessment was issued by Atkins to Wiltshire Council in May 2017.

The RING 3.2 and Archie M assessments were performed in accordance with BA 16/97 (Amendment No 2) and BD 21/01. Two independent assessment teams undertook the assessment of Devizes Castle bridge using RING and Archie M software.

There is some uncertainty as to the characteristic masonry strength and the assessments have been carried out using a conservative assumption of Engineering Brick B in 1:3 lime mortar following review of previous inspection photographs. Subsequent to the initial assessments, a sensitivity analysis was carried out to determine the structural capacity with four different assumed masonry strengths as outlined in section 3.2.

2. Previous Bridge Inspections

Devizes Castle is scheduled for a Principal Bridge Inspection in July 2017. As a result, Wiltshire Council requested the assessment by Atkins was to be carried out using information from the latest inspection reports and topographic survey of the arch profile rather than performing an inspection for assessment. Following the principal inspection in July 2017 the assessment can be retrospectively reviewed.

The available previous inspections are a 2011 'Detailed Inspection Report' by Birse Rail Consultancy and a 2015 'Visual Inspection Report' by Balfour Beatty. A topographical survey was carried out in December 2016 and is presented in Appendix C.

The Detailed Inspection in 2011 stated the overall condition of the bridge to be fair, and the main defects were noted to be:

- Longitudinal cracking to the arch barrel
- Vertical cracking to the south parapet
- Slight flattening of the arches
- Deep spalling to south arch ring face
- Brick voids to the wing walls
- General spalling, damp and calcite staining throughout

The Visual Inspection in 2015 stated the defects to be long-standing and the condition deemed not to have changed since the previous Principal Inspection.

3. RING 3.2 Assessment

3.1. Initial Assessment

The RING version 3.2 software models the arch in 2D, as a series of interacting blocks held in place by equilibrium of forces. The single, double and triple axle vehicle loads from BA 16/97 Table 3/6 are applied to the arch, with the effective arch width taken into account. The software calculates the critical failure mechanism for each applied load, considering hinge formation in the arch, masonry crushing and masonry sliding. The RING 3.2 calculations can be found in Appendix A.

The bridge was assessed for 40t Assessment Live Load (ALL) and the lower restricted loads, where applicable. The bridge adequacy factor for each applied load is defined by the Adequacy Factor output from RING (AF_{RING}) multiplied by the condition factor (F_{CM}). If this is more than 1.0, the structure passes the particular category of ALL. No failure mechanisms were restricted for the assessment.

As per the client request, the assessment shall be carried out using existing information from the previous 2011 and 2015 reports and topographic survey of the arch profile. The following are considered for the analysis.

- Uniform thickness of 564mm is assumed for the bridge arch barrel obtained from previous assessment calculations and photographs.
- The arch rings are assumed to be bonded.
- Engineering Bricks B in 1:3 Lime mortar is assumed.
- Backing is conservatively assumed to be absent.
- The bridge has a straight alignment and hence axle lift off condition shall not be considered.
- The skew span of the arch is considered for the RING analysis.
- The adopted condition factor is 1.0. The effect of spalling is considered by reducing the thickness of the arch barrel by 12mm. The deep spalling is prominent in face rings which are under the parapet. However, the spalling is only localised in other regions of the arch. Hence 1.0 is considered appropriate.

The RING 3.2 assessment gave a bridge capacity of 40t with a minimum adequacy factor of 1.06. Refer to the assessment calculations in Appendix A, for the critical axle load of each load category.

The condition factor is designed to be an objective assessment of the importance of the various cracks and deformation found on the arch barrel. In this assessment, a condition factor of 1.0 was adopted because from the available information the arch barrel was deemed to be in good condition with localised areas of spalling. The spalling has been accounted for by a uniform 12mm reduction in the arch barrel thickness. The adopted condition factor has a strong influence on the structural capacity of the bridge. For example, if the condition factor was reduced to 0.9 with no loss to the arch barrel thickness the bridge capacity drops to 33t restricted loading.

3.2. Sensitivity Analysis

The assessment of Devizes Castle Bridge was carried out based on the previous reports. There are no available record drawings of the bridge and testing of cores from the arch barrel was not carried out, hence there is some uncertainty in the adopted characteristic strength of the masonry. Consequently, following the initial RING 3.2 assessment, a sensitivity analysis was carried out to determine the capacity of the structure with four different assumed masonry strengths, listed below.

- a. Brick masonry characteristic strength of 10.5 N/mm² assuming Engineering Brick A in 1:2:9 mortar.
- b. Brick masonry characteristic strength of 8.75 N/mm² assuming Engineering Brick B in 1:2:9 mortar.
- c. Brick masonry characteristic strength of 6.5 N/mm² assuming wirecut bricks in 1:2:9 mortar.
- d. Brick masonry characteristic strength of 3.5 N/mm² assuming wirecut bricks in 1:3 lime mortar

It can be seen from the results presented in Appendix A, the adequacy factor falls as the brick masonry strength reduces. The lowest characteristic brick masonry strength for which 40t ALL capacity can be achieved is in fact 4.2N/mm². With a masonry brick strength of 3.5N/mm² the bridge structural capacity reduces to 33t restricted loading.

From the information available, it is uncertain whether the arch rings are bonded. A sensitivity analysis was carried out to compare the adequacy factor for the worst load case (11.5t Driving axle) as obtained from the assessment results for single ring of 564mm thickness with five de-bonded rings of 112.8mm thickness. As per the above assessments, the thickness of the outermost ring was reduced by 12mm to account for spalling. Assuming de-bonded rings significantly reduces the bridge structural capacity from 40t to 3t restricted loading, as presented in the results in Appendix A.

4. Archie M Assessment

4.1. Initial Assessment

Archie M carries out a thrust analysis and models the 2D line of compression of the arch. The software produces a graphical result, which either fails or passes the applied load. Unlike RING 3.2 software adequacy factors cannot be determined for loading categories. The structure either passes with an adequacy factor of greater than 1.0 or fails under the applied loading.

The Archie M assessment verified the outcome from the RING 3.2 assessment with an assessed capacity of 40t ALL.

4.2. Sensitivity Analysis

The sensitivity analysis indicated a capacity of lower than 40t only when the characteristic strength is dropped to 3.5N/mm², see Appendix B. The capacity with 3.5N/mm² characteristic strength was 12.5t restricted loading, although this was due to a marginal fail for the 11.5t single axle.

5. Conclusion

5.1. Structural Adequacy from Initial Assessment

The RING 3.2 assessment concluded a 40t capacity for the structure. This capacity was verified by an Archie-M assessment carried out by an independent team.

The assessed capacity of 40t is significantly greater than the 3t capacity given in the previous assessment carried out by Ringway Parkman in 2002. The previous assessment is deemed to be very conservative with an adopted condition factor of 0.7. Reviewing photographs of a typical structure with a condition factor 0.7 given in Annex D of BA 16/97, Devizes Castle is certainly in better condition with no significant longitudinal cracks to Voussoirs and little patch repair. A condition factor of 1.0 was deemed appropriate for Devizes Castle with the localised spalling accounted for, through a uniform 12mm reduction in the arch barrel thickness. The influence of the adopted condition factor was inspected by running the assessment with a reduced 0.9 condition factor. The resulting capacity was 33t restricted loading.

A topographic survey has enabled a more accurate depiction of the arch profile compared to the assumed profile by Ringway Parkman.

There is scope to retrospectively review this assessment following the Principal Inspection due for July 2017.

5.2. Sensitivity Analysis

The adopted masonry brick strength has a strong influence on the structural capacity of the bridge. A sensitivity analysis was carried out to determine the capacity of the structure with four different assumed masonry strengths. A 4.2N/mm^2 characteristic masonry strength (engineering bricks with 1:3 lime mortar) is sufficient to achieve 40t capacity. However, a reduction to 3.5N/mm^2 (wirecut bricks with 1:3 lime mortar) results in a capacity of 12.5t restricted loading according to Archie M assessment (although the RING 3.2 assessment indicated a capacity of 33t restricted loading).

Further sensitivity analysis assuming de-bonded rings concluded a 3t restricted capacity, significantly lower than the 40t structural capacity in the bonded state.

5.3. Recommendations

From the information available the bricks are likely to be some form of engineering bricks. However, it is recommended testing of cores taken from the arch barrel is carried out to ascertain with certainty the characteristic strength of the masonry.

It is recommended site testing is carried out to determine whether the rings are in fact de-bonded. The testing will initially consist of hammer tapping the barrel, the resulting nature of the sound released can indicate whether the arch rings are bonded. If the state of the rings is still uncertain, coring is recommended in critical locations. The coring can also validate the assumption that the barrel thickness is uniform. The barrel thickness may well be greater than indicated by the face rings. If de-bonding has occurred, stitching from the intrados of the arch is the recommended remedial measure.

If testing of arch barrel cores is not possible it is recommended the carriageway width is reduced using a traffic island and give-way signs are installed along Hillworth Road. This will ensure only one vehicle is ever travelling over the bridge rather than the more onerous load case considered in this assessment where both lanes are loaded.

Appendices

Appendix A. RING 3.2 Calculations

Wiltshire Highways Consultancy Contract – County Bridge Assessments

Assessment of Devizes Castle Arch Bridge

24 May 2017

Introduction

This report was developed as part of the 40 tonne Assessment Live Loading (ALL) rating for the “Devizes Castle” Masonry Arch Bridge. Sensitivity analysis was carried out to compare the effect of characteristic masonry strength, bonded and de-bonded rings for masonry arch on capacity of the arch barrel using RING 3.2 software for HA loading in accordance with BD 21/01. If the bridge does not pass 40 tonne ALL assessment, then it is assessed for restricted vehicle capacity for the loads shown in Table 3/6 of BA16/97.

Limitation of Modified MEXE Method for Devizes Castle Arch Bridge

Modified MEXE method in reference to the section 3.0 of BA16/97 is generally considered to be suitable for assessing the capacity of masonry arch structure unless:

- The method should not be used where the arch is flat or appreciably deformed.
- The bridge is found to be inadequate and more rigorous analysis is deemed necessary to confirm the results;
- When the depth of fill at the crown is greater than the thickness of the arch barrel;

Based on the above parameters, it was deemed necessary to assess the capacity of “Devizes Castle” Bridge using the Ring 3.2 since the thickness of the fill at crown was measured as 630mm and the thickness of arch barrel was only 564mm. No major deformations were being reported during the field inspection.

General Procedure for Ring 3.2 analysis

The assessment of arch barrel was carried based using the principles as outlined below:

Modelling and Analysis:

1. Check for suitability of Ring 3.0 software
 - a) span < 20.0m
 - b) span/rise < 6
 - c) Fill depth at crown < span / 2
2. The number of notional lanes is determined based on clause 5.6 of BD 21/01.
3. The effective width of the arch barrel is calculated by the software itself. However, an upper-bound value is given which is least of:
 - i) For vehicle occupied on single lane:
 - a) Total width of the bridge / no of notional lanes
 - b) Spacing between outer wheels of the axle of applied load + depth of fill at 1/3rd span + 1.5m
 - c) Spacing between the longitudinal cracks (if cracks are continuous and widespread)
 - ii) For two vehicles occupied on two lanes:
 - a) Total width of the bridge.
 - b) Spacing between outer wheels of the axle of applied load (1.8+1.0+1.8) + depth of fill at 1/3rd span + 1.5m
 - c) Spacing between the longitudinal cracks (if cracks are continuous and widespread)
4. Joint Factor F_j , which covers the reduction for defects in Joint width (F_w), Joint depth (F_d) and Mortar loss (F_{mo}) and is modelled in Ring 3.2 as described below:
 - a. Joint width and Mortar loss defects have been accounted by reducing the characteristic strength of the masonry as follows:

The characteristic strength of normal brick masonry considering Engineering Brick B in 1:3 Lime mortar = 4.2 N/mm²

Therefore, reduced characteristic strength modelled in RING 3.2 = $4.2 \times 1.0 \times 0.9 = 3.78$ N/mm²
 - b. Joint depth defects have been accounted as follows:
 - $F_d = 1.0$ Mortar seems to be in good condition. However, 1/10 of brick thickness (12 mm) is reduced to accommodate the spalling of the bricks. Hence the depth of the barrel is taken as 552mm.
5. The dead load and weight of fill are applied by the software itself. The density is based on Table 4.1 of BD 21/01.

6. The bridge is assessed for the following single, double and triple axle live loads of
- 40 tonne ALL - as per Table 3/6 of BA 16/97
 - Single axle of 11.5 t – 1x11.5 t
 - Double axle of 10.0 t – 2x10.0 t
 - Triple axle of 8.0 t – 3x8.0 t
 - Driving axle of 11.5 t – 1x11.5 t + 1x7.5 t
 - If the bridge does not pass 40 tonne ALL assessment, then it is assessed for restricted vehicle capacity for the loads shown in Table 3/6 of BA16/97.
7. The assessment is carried out based on following load factors
- As per Clause 6.25 of BD 21/01, two analyses shall be carried out
 - Unfactored dead load where the partial factor for masonry weight, fill and surfacing shall be taken as 1.0
 - All dead loads shall be factored to ULS as per Table 3.1 and Cl. 3.10 of BD 21/01

| | | |
|---------------------------------------|---------------|---------|
| Partial factor for masonry | = 1.15 x 1.10 | = 1.265 |
| Partial factor for fill | = 1.20 x 1.10 | = 1.320 |
| Partial factor for surfacing material | = 1.75 x 1.10 | = 1.925 |
 - For 40 tonne ALL loading, γ_{FL} is taken as 3.4 for one critical axle and 1.9 for other axle as per clause 6.2 of BD 21/01.
 - To account for the inaccurate assessment of the effects of loading, γ_{FB} is taken as 1.1 as per clause 3.10 of BD 21/01.

Adequacy:

If adequacy factor $AF_{Ring}^* F_{CM}$ is more than 1.0, the structure passes the assessment to the category of Assessment Live Load

40 tonnes ALL as per BD 21/01

Result Summary for 40 tonne Assessment Live Loading:

Adequacy factors from Ring 3.2

| Vehicle Type | Single Lane | Double Lane | Single Lane | Double Lane |
|--|-------------|-------------|-------------|-------------|
| 40t ALL- Table 3/6 of BA 16 / Annex A of BD 21/01 with Unfactored dead loads | | | | |
| 11.5 t Single axle | 1.610 | 1.350 | Pass | Pass |

| 11.5 t Driving axle | 1.340 | 1.130 | Pass | Pass |

Sensitivity Analysis

The assessment of the Devizes Castle Bridge was carried out based on the previous 2011 Detailed Inspection report and 2015 Visual Inspection report as per the client's request. Testing was not carried out and hence there is uncertainty in the strength of the masonry and the original configuration of the arch barrel. Hence, further to discussion with the Client, two sensitivity analysis was carried out. One was to compare the effect of characteristic masonry strength and the other was to compare the effect of bonded and de-bonded rings for masonry arch, on the capacity of the arch barrel.

Sensitivity analysis 1 - The effect of characteristic masonry strength on the capacity of the bridge.

A sensitivity analysis was carried out to compare the effect of characteristic masonry strength on the capacity of the arch barrel. It was carried out for the worst load case (11.5 t Driving axle with unfactored dead load) as obtained from the assessment results for:

- Brick masonry characteristic strength of 10.5 N/mm² assuming Engineering Brick A in 1:2:9 mortar.
- Brick masonry characteristic strength of 8.75 N/mm² assuming Engineering Brick B in 1:2:9 mortar.
- Brick masonry characteristic strength of 6.5 N/mm² assuming wirecut bricks in 1:2:9 mortar.
- Brick masonry characteristic strength of 3.5 N/mm² assuming wirecut bricks in 1:3 lime mortar

Result Summary for sensitivity analysis 1:

Adequacy factors from Ring 3.2

| Brick masonry characteristic strength (N/mm ²) | Single Lane | Double Lane | Single Lane | Double Lane |
|--|-------------|-------------|-------------|-------------|
| 11.5t Driving double axle with Unfactored dead loads | | | | |
| 10.5 | 1.880 | 1.600 | Pass | Pass |
| 8.75 | 1.790 | 1.510 | Pass | Pass |
| 6.5 | 1.600 | 1.350 | Pass | Pass |
| 3.5 | 1.100 | 0.931 | Pass | Fail |

Sensitivity analysis 2 – The effect of bonded and de-bonded rings for masonry arch.

A sensitivity analysis was carried out to compare the adequacy factor for the worst load case (11.5 t Driving axle with unfactored dead load) as obtained from the assessment results for single ring of 564mm thickness with five rings of thickness 112.8mm each. The thickness of the outermost ring was reduced by 12mm to account for spalling.

Result Summary for sensitivity analysis 2:

Adequacy factors from Ring 3.2

| Vehicle Type / Arch Barrel Ring Type | Single Lane | Double Lane | Single Lane | Double Lane |
|--|-------------|-------------|-------------|-------------|
| Brick masonry Strength of 4.2 N/mm ² with Unfactored dead loads | | | | |
| Bonded rings with double axle 11.5t driving | 1.260 | 1.060 | Pass | Pass |
| De-bonded rings with 5.5t Single Axle (7.5t loading) | 0.628 | 0.528 | Fail | Fail |
| De-bonded rings with 2t Single Axle (3 t loading) | 1.730 | 1.450 | Pass | Pass |

Recommendations:

Inspections were not carried out for the assessment. The assumptions for assessment are based on the previous 2011 Detailed Inspection report and 2015 Visual Inspection report. Hence, the validity of the assessment depends on the veracity of the assumptions which needs to be confirmed on site.

It is also recommended to carry out intrusive investigations to obtain the actual configuration of the arch barrel, the thickness of the arch barrel and the actual depth of fill. As the adequacy of the structure also depends on the masonry strength, it is recommended to carry out material testing.

Appendices

Appendix A. Output from Ring 3.2

Sample calculations of two vehicles of Double Axle, 11.5 tonne Driving on two lanes loading with un-factored dead load, attached for reference.

Summary

Details

| | | | |
|---|---|--|---|
| Bridge name Devizes Cast e Bridge | Location The bridge carries an unclassified single carriageway, Hi worth road over the disused Devizes branch railway line. | Reference No. Devizes Cast e Bridge is located at OS grid reference of SU 005 610. | Map reference |
| Bridge type Highway | Name of assessor Taraka | Assessing organization WS Atkins | Date of assessment Monday, May 22, 2017 |
| Max auto-computed effective bridge width 6900 | Extra bridge width to include 1500 | Backfill transverse spread (Degrees) 26.6 | Surface fill transverse spread (Degrees) 26.6 |

Comments

Loading considered is two vehicles of Double driving axle of 11.5t Unfactored dead loads are considered (Partial factor is 1.0) Number of units are considered as 60. The adequacy factor is not depending on number of units, if these are exceeding 60.

Results

| | |
|--|---|
| Adequacy factor 1.06 at load case #67 (this is the critical load case) | Solver used (if not default) CLP solver |
|--|---|

Mode of Response for Current Load Case

Units

Unless specified otherwise, the following units are used throughout this report:

| | | | | | |
|-----------------------|---------------------|-----------------------|-------------------------|---|---|
| Distance mm | Force* kN | Moment* kNm | Angle Degrees | Unit weight kN/m ³ | Material strength N/mm ² |
|-----------------------|---------------------|-----------------------|-------------------------|---|---|

* = per metre width

Geometry

| | | | | |
|----------------|-----------------------|--|------------------|-----------------------------|
| Global: | No. Spans 1 | Effective bridge width 6850.12 | | |
| Span 1: | Type | Shape | No. Rings | Bed joints normal to |

| | | | |
|--------------|----------------|---|-----------------|
| Bonded brick | User defined | 1 | intrados |
| | (interpo ated) | | Yes |

Intrados points (local to left springing of this span):

| | | |
|----------------|-------------------|-----------------------|
| x | y | |
| 0 | 0 | |
| 1407 | 1220 | |
| 2814 | 2047 | |
| 4221 | 2521 | |
| 5628 | 2816 | |
| 7035 | 3029 | |
| 8442 | 3101 | |
| 9489 | 3045 | |
| 11256 | 2882 | |
| 12663 | 2561 | |
| 14070 | 2104 | |
| 15477 | 1323 | |
| 16884 | 236 | |
| Ring 1: | No. Blocks | Ring thickness |
| | 60 | 552 |

Fill Profile Properties

Distances measured from left springing point of left span.

| Horizontal distance (x) | Height to surface fill (y) | Surface fill depth (d) | Surface level (y+d) |
|-------------------------|----------------------------|------------------------|---------------------|
| 0 | 4297 | 100 | 4397 |

Partial Factors

Loads

| Masonry unit weight | Fill unit weight | Surface unit weight | Axle load | Dynamic |
|---------------------|------------------|---------------------|-----------|---------|
| 1 | 1 | 1 | 2.09 | 1.8 |

Materials

| Masonry strength | Masonry friction |
|------------------|------------------|
| 1 | 1 |

Fill Properties

Backfill

| | | |
|---|--|-----------------|
| Unit weight | Angle of friction | Cohesion |
| 18 | 25 | 0 |
| Model dispersion of live load? | Model horizontal 'passive' pressures? | |
| Yes | Yes | |
| Dispersion type | Cutoff angle | |
| Boussinesq | 30 | |
| Soil arch interface, friction multiplier | Soil arch interface, cohesion multiplier | |
| 0.66 | 0.5 | |
| Mobilisation multiplier on Kp (mp) | Mobilisation multiplier on cohesion (mpc) | |
| 0.33 | 0.05 | |
| Keep mp.Kp > 1? | Auto identify passive zones? | |

Yes

Yes

Surface Fill

Basis of effective bridge width of 3.305m

The depth of fill at 1/3rd location was used for the calculation of effective width, as it is the critical position for comparing the effects of different axles (Ref: Annex B, Clause B2 of BA 16/97).

$$\text{Effective width for one vehicle} = \frac{2.31}{2} + 1.8 + \frac{0.7}{2} = 3.305\text{m}$$

Devizes Castle

LC1A 3.5N/mm2 Brick double axle bogie

gammaFI dead load: 1.00 Driving Axle (1.3m air) imp right @ 11126 [mm]
gammaFI superimposed: 1.00
gammaFI live load: 2.32
gammaF3 load effect: 1.00
gammaM material: 1.00
File path: C:\Users\cpire\Documents\Devizys Castle\Basemodel 3.305.brg

NAME: Devizes Castle
LOCATION: Hillworth Road
NUMBER:
ATKINS
DATE: 30 May 2017
Printed on: Tuesday, May 30, 2017 23:04:35

Bridge Name: Devizes Castle Bridge Location: Hillworth Road

Bridge Number:

Number of spans: 1

SAFETY FACTORS

Factor for deadload: 1.00 Factor for superimposed deadload: 1.00 Factor for surfacing: 1.00

Factor for live load: 2.32 Factor for load effect: 1.00 Factor for material strength: 1.00

APPLIED LOAD CASES

1.Driving Axle (1.3m air) imp right Total weight: 186.39 [kN] Position: 11126 [mm]

19.00 2 1.00 7.50 1.30 20.70 1.00 1.80 2.50

Effective lane width: 3305 [mm] Distribution length: 1007 [mm]

Applied distribution mode: Archie-M, BD21/97

Applied live load pressure: Active pressure

STRUCTURE PROPERTIES

Road shape: Flat line (1-point method)

Road points: (0, 4295)

Depth of surfacing: 1 Depth of overlay: 0

Surface unit weight: 18.00 [kN/m3] Overlay unit weight: 18.00 [kN/m3]

Lane width: 2500

Fill unit weight: 18.00 [kN/m3] Fill phi: 25 degree

Fill unit weight: 18.00 [kN/m3] Fill phi: 25 degree

Shape: True shape

Span: 16884 [mm] Rise: 3101 [mm] Q-rise: 0 [mm]

Ring thickness at crown: 564 [mm] Ring thickness at springing: 564 [mm] Mortar loss 12 [mm]

Masonry unit weight: 20.00 [kN/m3] Masonry strength: 3.50 [MPa]

Printed on: Tuesday, May 30, 2017 23:06:13

Bridge Name: Devizes Castle Bridge Location: Hillworth Road

Bridge Number:

Number of spans: 1

SAFETY FACTORS

Factor for deadload: 1.00 Factor for superimposed deadload: 1.00 Factor for surfacing: 1.00

Factor for live load: 2.32 Factor for load effect: 1.00 Factor for material strength: 1.00

APPLIED LOAD CASES

1.Triple Axle (2.6 m) impact centre Total weight: 235.44 [kN] Position: 11126 [mm]

24.00 3 1.00 8.00 1.30 14.40 2.60 8.00 1.00 1.80 2.50

Effective lane width: 3305 [mm] Distribution length: 935 [mm]

Applied distribution mode: Archie-M, BD21/97

Applied live load pressure: Active pressure

STRUCTURE PROPERTIES

Road shape: Flat line (1-point method)

Road points: (0, 4295)

Depth of surfacing: 1 Depth of overlay: 0

Surface unit weight: 18.00 [kN/m3] Overlay unit weight: 18.00 [kN/m3]

Lane width: 2500

Fill unit weight: 18.00 [kN/m3] Fill phi: 25 degree

Fill unit weight: 18.00 [kN/m3] Fill phi: 25 degree

Shape: True shape

Span: 16884 [mm] Rise: 3101 [mm] Q-rise: 0 [mm]

Ring thickness at crown: 564 [mm] Ring thickness at springing: 564 [mm] Mortar loss 12 [mm]

Masonry unit weight: 20.00 [kN/m3] Masonry strength: 3.50 [MPa]

Factor for live load: 2.32 Factor for load effect: 1.00 Factor for material strength: 1.00

APPLIED LOAD CASES

1. 13-t Single Axle with Impact Total weight: 88.29 [kN] Position: 9626 [mm]

9.00 1 1.00 16.20 1.00 1.80 2.50

Effective lane width: 3305 [mm] Distr bution length: 994 [mm]

Applied distribution mode: Archie-M, BD21/97

Applied live load pressure: Active pressure

STRUCTURE PROPERTIES

Road shape: Flat line (1-point method)

Road points: (0, 4295)

Depth of surfacing: 1 Depth of overlay: 0

Surface unit weight: 18.00 [kN/m3] Overlay unit weight: 18.00 [kN/m3]

Lane width: 2500

Fill unit weight: 18.00 [kN/m3] Fill phi: 25 degree

Fill unit weight: 18.00 [kN/m3] Fill phi: 25 degree

Shape: True shape

Span: 16884 [mm] Rise: 3101 [mm] Q-rise: 0 [mm]

Ring thickness at crown: 564 [mm] Ring thickness at springing: 564 [mm] Mortar loss 12 [mm]

Masonry unit weight: 20.00 [kN/m3] Masonry strength: 3.50 [MPa]

Devizes Castle

LC3A 8.75N/mm2 Brick Most onerous vehicle

gammaFI dead load: 1.00 Driving Axle (1.3m air) imp right @ 13626 [mm]
gammaFI superimposed: 1.00
gammaFI live load: 2.32
gammaF3 load effect: 1.00
gammaM material: 1.00
File path: C:\Users\cpire\Documents\Devizys Castle\Basemodel 3.305.brg

NAME: Devizes Castle
LOCATION: Hillworth Road
NUMBER:
ATKINS
DATE: 30 May 2017
Printed on: Tuesday, May 30, 2017 22:56:20

Factor for deadload: 1.00 Factor for superimposed deadload: 1.00 Factor for surfacing: 1.00
Factor for live load: 2.32 Factor for load effect: 1.00 Factor for material strength: 1.00

1. Driving Axle (1.3m air) imp right Total weight: 186.39 [kN] Position: 13626 [mm]
19.00 2 1.00 7.50 1.30 20.70 1.00 1.80 2.50
Effective lane width: 3305 [mm] Distr bution length: 1365 [mm]

Road shape: Flat line (1-point method)
Road points: (0, 4295)
Depth of surfacing: 1 Depth of overlay: 0
Surface unit weight: 18.00 [kN/m³] Overlay unit weight: 18.00 [kN/m³]
Lane width: 2500

Shape: True shape
Span: 16884 [mm] Rise: 3101 [mm] Q-rise: 0 [mm]
Ring thickness at crown: 564 [mm] Ring thickness at springing: 564 [mm] Mortar loss 12 [mm]
Masonry unit weight: 20.00 [kN/m3] Masonry strength: 8.75 [MPa]

I think the problem we have had all along with this structure is trying to get an accurate arch profile, not only is it difficult to reach but also it springs from the sides of the cutting rather than having conventional abutments. Having personally been involved in the 2002 report survey I wouldn't claim that to be 100% accurate.

The survey we did for this latest assessment was a laser scan of the structure so I am confident it is correct. I believe the span / rise we have used is the centreline of the bridge rather than one of the elevations which was possibly what was used before; the photo below shows why there is probably some ambiguity between the two. Quite why there is such a large difference between your archive data and what we have found through laser scanning I'm not sure, it does look as if there has been some localised embankment erosion which may have led to an apparent increase in span in the absence of any 'fixed' abutments.

I think this bridge was due it's next detailed inspection earlier this summer, would you be able to share the report once you have received it?

Subject: RE: Hillworth Road / Devizes Castle Bridge, Devizes 85m 38c BHL

Hi Julian

Apologies for the delayed response.

I've just had an initial scan through and the first concern I have is in the span/rise dimensions that we appear to have for each face of this structure:

The archive data gives the face spans as 14.86m & 14.94m.

The 2002 assessment report gives them as 16.4m & 16.7m (with 2.75 & 3.37m 'rise at crown' readings respectively)

This latest assessment gives them as 16.88m with 3.1m 'rise at crown' (presumably taking the worst case)

The spread of results appears quite large, which raises the question as to whether the measurements were inaccurate, and if so which? A possible alternative is that all readings have been accurate and the bridge is spreading/flattening. Comparing the 2017 and 2002 data, the 2017 span is larger than either previously recorded and the 'rise' falls roughly midway between both previously measured. This would, if the results are all accurate, suggest a trend towards a flattening/spreading of the arch.

So, at the risk of a loaded question, how confident are you in the 2002 and 2017 measurements?

Thanks

I had our Consultant take a look at this bridge as there were always doubts in my mind about the original assessments. They have concluded that the bridge might / should be rated at 40T, could you have a look at their report and let me know what you think?

Cheers

Julian Haines

Morning Julian

In terms of exams reports – the most recent Detailed Exam report is from 2011 and the most recent Visual Exam report is from 2015. I've attached these. As you can see by the dates, we should be receiving the 2016 VE sometime in the next few weeks, so I can forward that when received.

I'm not sure what your timeframes for work are like, but the next DE will be July/Aug next year, which will obviously necessitate 'touching distance' access, so there may be scope for you to piggy-back onto this or for me to see if the examiners will pick up measurements for you – just a thought.

Cheers

We have this structure as a substandard bridge and need to start looking at possible mitigation / strengthening measures. The first thing we will do is undertake a further assessment and profile survey; if you know the bridge you'll realise the difficulties in getting a true profile, recent scanning technology should however solve that for us. I was wondering do you have an up to date PBI for the bridge that you would be willing to share, this would save us the expense of getting scaffold / underbridge unit in .

Cheers
