# THIS QUESTION PAPER MUST BE HANDEDIN TO THE INVIGILATOR AT THE END OF THE EXAMINATION 

# CRANFIELD UNIVERSITY 

Examination

## SCHOOL OF ENERGY, ENVIRONMENT AND AGRIFOOD Water and Wastewater Engineering STREAM

## PROCESS SCIENCE AND ENGINEERING

Tuesday 5 January 2016: 13.00-15.00
Open Book / Open Note

## INSTRUCTIONS TO CANDIDATES:

Answer ALL questions
Start each answer on a separate page.
Candidates are allowed a non-programmable calculator.
Watermaths text and annotations in the book only.

PAGE LEFT INTENTIONALLY BLANK

## You are expected to answer all questions

Provide the results and the process through which you obtained the results (equations, assumptions ...)

| \# | Question | Mk |
| :---: | :---: | :---: |
| 1 | A $10 \mathrm{~m}^{3}$ CSTR treats water flowing at $25 \mathrm{~m}^{3} / \mathrm{h}$, what is the removal efficiency ( 1 decimal) when the reaction rate is 0.08 per min? | 6 |
| 2 | A treated effluent has a bacteria count of $100 \mathrm{cfu} / \mathrm{mL}$ and a phosphorus concentration of $2 \mathrm{mg} / \mathrm{L}$. Assuming phosphorus is the limiting nutrient, what will be the bacteria concentration after 24 hours of storage if the half saturation coefficient is $11 \mathrm{mg} / \mathrm{L}$ and the specific growth rate is 0.035 per min? | 4 |
| 3 | What is the half-life of phenol $\left(\mathrm{C}_{6} \mathrm{H}_{6} \mathrm{O}\right)$ in wastewater comprising a concentration of $47 \mathrm{mg} / \mathrm{L}$ assuming a second order reaction and a rate constant of $80 \mathrm{~L} /(\mathrm{mol} \cdot \mathrm{day})$ ? | 5 |
| 4 | Water containing $25 \mathrm{mg} / \mathrm{lCO}_{2}$ flows at $50 \mathrm{~m}^{3} / \mathrm{h}$ through a stripper fed with $0.05 \% \mathrm{CO}_{2}$ in air which is flowing at a rate of $75 \mathrm{~kg} / \mathrm{h}$. What is the outlet aqueous $\mathrm{CO}_{2}$ concentration (in $\mathrm{mg} / \mathrm{L}, 2$ decimals) if the off-gas contains $1.2 \% \mathrm{CO}_{2}$ ? Assume no loss of water by the process and no changes in the $\mathrm{CO}_{2} / \mathrm{HCO}_{3}{ }^{-}$equilibrium. | 7 |
| 5 | A water flow of 20 MLD (megalitres/day) containing $250 \mathrm{mg} / \mathrm{L}$ suspended solids is to be clarified to produce treated water containing $50 \mathrm{mg} / \mathrm{L}$ total suspended solids and a sludge product of solids concentration $22 \mathrm{~g} / \mathrm{L}$. | 10 |
|  | a) What is the flow rate of the clarified water in $\mathrm{m}^{3} / \mathrm{h}$ ( 2 decimals)? | 5 |
|  | b) What percentage of the feedwater solids are recovered in the sludge ( 1 decimal)? | 5 |
| 6 | Wastewater at $20^{\circ} \mathrm{C}$ flows through a 5 cm diameter precast concrete pipe at a flow of $5 \mathrm{~m}^{3} / \mathrm{h}$. Turbulent flow conditions are required to avoid settling of solids in the pipe. | 10 |
|  | a) Are the conditions adequate? | 5 |
|  | b) What is the minimum flow (in $\mathrm{m}^{3} / \mathrm{h}, 2$ decimals) required to obtain turbulent conditions? | 5 |
| 7 | Water at $10^{\circ} \mathrm{C}$, initially stored in a tank, is fed through a 50 mm diameter pipe to a treatment unit (at ground level) requiring a flow of 15 $\mathrm{L} / \mathrm{s}$. At what height (in $\mathrm{m}, 2$ decimals) should the tank be installed knowing that both the tank and pipe outlet are open to the atmosphere? | 7 |
| 8 | What is the molar concentration ( 2 decimals) of a ferric chloride solution with a $17 \%$ weight concentration ( $\mathrm{w} / \mathrm{w}$ ) and a density of $1.4 \mathrm{~kg} / \mathrm{L}$ ? | 6 |
| 9 | The pH of a water is adjusted by adding sulphuric acid $\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)$ at a concentration of 0.005 M . | 12 |
|  | a) What is the final pH if the initial pH was 7.8? | 6 |
|  | b) What would be the final pH ( 2 decimals) if the water contained a bicarbonate concentration of 55 mM ? | 6 |
| 10 | Determine the mass transfer coefficient (1 decimal) for oxygen when water at $20^{\circ} \mathrm{C}$ passes through a 10 mm pipe at a flow rate of $1.3 \mathrm{~L} / \mathrm{min}$. | 12 |
| 11 | Oxygen mass transfer takes place across a $3.5 \mathrm{~m}^{2}$ boundary from a solution in equilibrium with air to a non-equilibrated solution with a dissolved oxygen concentration of $1.5 \mathrm{mg} / \mathrm{l}$ at a rate of $786 \mathrm{mg} / \mathrm{min}$. If the mass transfer coefficient is $3 \times 10^{-4} \mathrm{~m} / \mathrm{s}$, what is the partial pressure of the equilibrated solution (in atmospheres, 3 decimals)? | 6 |
|  | Total | 85 |
